I purchased the adms2-c software, tried the so-called european mod
to
no avail. If there is a "FREEBAND" type of mod for this unit, It is in
the
radio or keypad.

Still looking, 73, -=MIKE=-

2. Kenwood TH-79A -How do manual offset?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-01 00:00:00 UTC

Message-ID: <19970101235800.SAA25858@ladder01.news.aol.com>
Source record: 187184

I have a new Kenwood TH 79-A 144/440 with an Automatic Offset of + -
600Khz for use with repeaters. I have found out how to do manual offset,
but it seems to be for the whole radio. I am trying to figure out if it is
possible to program in a separate offset for one frequency only.
Specifically, there is a repeater with a 1.035 MHz offset in S. CA. which
I want to program in. Can anybody help?

3. *4 SALE* TEKTRONIX 7104 1GHz OSCILLOSCOPE

John, Do you work mostly SSB or CW? On SSB, you might need the legal
limit to break through a SSB pileup when the DX is operating transceive
but for CW, don't bother. Skill is worth a lot more than a gain of 1
s-unit.

7. Help 80m Amp Anomaly?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-01 00:00:00 UTC
From: "Brian K. Short" <ke7gh@primenet.com>
Message-ID: <32CB12F2.6C67@primenet.com>
Source record: 187189

Stayed up extra late New Years morning to make a few casual
RTTY contacts in the SARTG New Years RTTY Sprint and had
an unusual occurrence that I would like to solicit comments about.

I recently added a Viking MB-V-A tuner to my station and changed
my 80m antenna to ladder line fed (160' long, center fed). I have
never before tested for any long period this antenna/tuner combination
with an amplifier.

Last night I was running about 900-1000w on RTTY. I was CQ'ing at
a rather low intermittant rate while working on some other things in
the shack. Suddenly, the amp shut down, blowing both 250v 15a fuses.
Everything had been ok previously and I had made a few QSOs prior.

I later put in some (smaller) fuses I had on hand and performed a
cursory
test. HV is etc is all ok. Tested at reduced drive on 40m up to about
400-500w out level and all was fine. I suspect something arced, causing
the sudden disruption (talk about starting the new year right). The SWR
to the amp was low over the entire RTTY range.

Questions: I don't beleive the MB-V-A would arc (settings 14-1-23)?
The
load control on my AL-1200 was very low (about 0, seemed to peak there,
though)? I also have an Autek WM1 meter in line, but it never has arced
before (never ran 80m QRO with it though)? There is also a high power
ICE
low pass filter in line? As for the antenna, no snow or ice accumulated
(I'm
near Phoenix), but it was damp out? Never applied high power to it
before?
FT-1000mp was at reduced power out? I suspect it may be just the
loading
of the amp?

Any suggestions of avoiding future problems? Where is a good source of
spare 250v 15a ceramic fuses?

I'd like to feel more comfortable operating 80m this weekend?

73, Brian ke7gh@primenet.com

8. YAESU parts

Newsgroup: rec.radio.amateur.equipment

The digital frequency diplay of my FT107 has lost some segments, due to
a partially defective counter chip.
Does anybody has this counter chip, or info how to obtain this chip.
The LSI counter chip is called MSM9520RS.
This one is also used in the FT707. Yaesu has no stock left.
Best regards and hope to hear from you...Gerard PA2GBK

9. solarpower handhelds

Newsgroup: rec.radio.amateur.equipment

From: Paul Stay <stay@arl.mil>
Message-ID: <32CB0A66.450D@arl.mil>
Source record: 187191

I am interested if anyone has experience in seting up a solar power system for utilizing the yeasu FT10 (or any other handheld) for long term use in the field. I have a project that I need to establish a remote 2m network in the Amazon Rain forest for 31 small Indian villages using central repeater.

I am presently investigating utilizing the FT10 with a 7 amp/hour gel cell battery, with a charge controller. The entire unit will be housed in a hermetically sealed high impact box, with a battery in a lower vented compartment with the other items in the sealed compartment. We will use a 5 watt solar panel producing 12+ volts at 250 milliampheres.

> hobbes99@ziplink.net

I have a page that describes a six-meter duplexer that can
be scaled to 440 MHz. We scaled the six design to two meters
even though I don't mention it on the page.

If you do scale the six meter design to 440 MHz you can probably
use 1/2" Heliax instead of 1 1/4".

The page is at:
http://www.dallas.net/~jvpoll/dup6m/dup.html

Hope this helps.
Jim

> Happy New Year
I run an Alinco DX-70T to an Outbacker on a mag mount on the roof of a
'91 Toy Landcrusher with great results - there is some noise but it is
not much at all compared to other installations.
Can't speak for the '96's...
Toyota does have a service buletin out that details radio installation,
but I have not seen it. It may be worth checking into.
My suggestion is to find a friend with a rig and antenna and try it out
- if there is noise, there are fixes that can be done.
Good luck -
Ernie

MTX - 810 Cannot be used on Ham Bands. Its is a trunking radio capable
of "Talk-Around" on 800 Mhz band, as opposed to the MTX 800 which would
only do Trunked modes.

Yes. I used one for years on these modes. The only thing I had to do was make
sure the TX delay was set to about 70ms. It switches a little slow. If you can
find the review the ARRL did on it then the switching time is there.
Dave

Message-ID: <32c9e29e.56164854@news.erinet.com>
Source record: 187236

Anyone know how to adjust the power on the 570. I would like to set
it to 5 watts for the 5 watt position instead of the 3 watts it is
now. Also, did I miss something, did Kenwood eliminate the ability
to set the dial revolution to 10/5 khz per revolution? I know there
is a "FINE" position, but I would like something in between the 10 khz
or 1 khz. I think the 850/450 radios would allow this. Thanks
Tim

You would be better off with an HW8 or 9. The 7 had
numerous problems.
There are various fixes available for the 7 but why
bother when the newer ones are already fixed.

Consider keeping your PK-232 and adding a Timewave DSP-599zx in front
of it. Their model 59+ and 9+ also do a good job improving weak signal
digital communications.

The Dark Sucker Theory
For years, it has been believed that electric bulbs emit light,
but
recent information has proved otherwise. Electric bulbs don't emit
light; they suck dark. Thus, we call these bulbs Dark Suckers. The
Dark
Sucker Theory and the existence of dark suckers prove that dark has
mass
and is heavier than light.
First, the basis of the Dark Sucker Theory is that electric bulbs
suck dark. For example, take the Dark Sucker in the room you are in.
There is much less dark right next to it than there is elsewhere. The
larger the Dark Sucker, the greater its capacity to suck dark. Dark
Suckers in the parking lot have a much greater capacity to suck dark
than the ones in this room.
So with all things, Dark Suckers don't last forever. Once
they are
full of dark, they can no longer suck. This is proven by the dark
spot
on a full Dark Sucker.
A candle is a primitive Dark Sucker. A new candle has a white
wick.
You can see that after the first use, the wick turns black,
representing
all the dark that has been sucked into it. If you put a pencil next
to
the wick of an operating candle, it will turn black. This is because

it got in the way of the dark flowing into the candle. One of the
disadvantages of these primitive Dark Suckers is their limited range.

There are also portable Dark Suckers. In these, the bulbs
can't
handle all the dark by themselves and must be aided by a Dark Storage

Unit. When the Dark Storage Unit is full, it must be either emptied

or replaced before the portable Dark Sucker can operate again.
Dark has mass. When dark goes into a Dark Sucker, friction from the
mass generates heat. Thus, it is not wise to touch an operating
Dark Sucker. Candles present a special problem as the mass must
travel
into a solid wick instead of through clear glass. This generates a

great amount of heat and therefore it's not wise to touch an operating

candle.
Also, dark is heavier than light. If you were to swim just
below
the surface of the lake, you would see a lot of light. If you were to

slowly swim deeper and deeper, you would notice it getting darker and

darker. When you get really deep, you would be in total darkness.
This
is because the heavier dark sinks to the bottom of the lake and the

lighter light floats at the top. The is why it is called light.

Finally, we must prove that dark is faster than light. If you
were
to stand in a lit room in front of a closed, dark closet, and slowly

opened the closet door, you would see the light slowly enter the
closet.
But since dark is so fast, you would not be able to see the dark leave

the closet.
Next time you see an electric bulb, remember that it is a Dark
Sucker.

Where ever did you get the information that the TS930 was junk?. Of all radios in the past that are transistorized the 930 probably has the best reputation of all! Granted it has one large board, however than board is easily repaired in preference to god awful sockets for multiple boards that become intermittent.
As for the comment that the radio has high intermod, rubbish! Ask any DX-er or field day operator why they retain the 930 over all others.
This rig will not get off with total compliments. There is an insisent problem in the high current regulator board in both the 930 and 940. It is mounted right next to the power transformer and runs far too hot! The only answer---be sure that the cooling fan is operating properly. ALWAYS!

Check Radio Shack again, but use the catalog vice asking a sales associate
(or talk directly to the manager). Many of the clocks in the RS line are
dual - both 24 hr format and am/pm. The catalog will tell you which. A
sales associate may not know this, especially if they are new.

Hi and thanks for reading this. I have a Tripp Lite PR-25 power supply that trips off when I transmit. I can even trip it off with my 2.5 watt 2m handheld. I think RF is getting into it and causing it to trip. Has anyone else had this problem? Where should I start to look for a cure? I have e-mailed Tripp Lite but got no responce. I have no schematic..

While I was attempting to replace the mike connector, I crossed up something, and the rig went into some sort of shut down mode. I have tried the memory reset and VFO reset with no success, maybe I have fried something, or possibly there is some sort of "hard reset" that will get the rig working. I sure would appreciate any helpful suggestions you may have. BTW those new 8 pin modular "telephone" type plugs and a real pain to replace.

> Luis/n3tuk

From the literature, it seems that the only thing the 9600 setting does
is adjust the level of the signals on the TNC connector. The radio does
have some neat features, but if you ever lose the manual, you're SOL.
Also, the tnc connector is a mini-din connector, not the standard mike
din connector, so get the cable too (I think it's part # ts5 or something
like that).
I like the wide-band receive, too. Comes in handy.

Enjoy,
73,
Phil

Just make sure the drip pan under that grid leak is empty...

Actually, that doesn't sound like magic smoke is leaking out; it's probably
a power resistor that builds up dust and smells like a heater when you
first turn it on.

Is that why they call it a TripLite? :)

54. TS570D rig review

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-01 00:00:00 UTC
From: Rick Lapp <rickl@unix.asb.com>
Message-ID: <E3C8t1.Lp5@nonexistent.com>
Source record: 187263
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Several here have asked that I re-post my review:

These are my Impressions of the TS-570.
My thanks to Joe, W2HPM who also spent some
time with me reviewing this new Kenwood.

I'm comparing the radio based on others I have owned:
940, 765, 850, Omni6, 450, 50, Delta2, and a 706. I've also
operated the FT-1000 enough to compare it to the others.

The radio was setup by removing all the connectors from the
450 and simply plugging them into the 570. Only the CW jack
changed from a "phone jack to an 1/8" mini which was
quickly fixed with an adapter. The amplifier keying and
PK232 interface all worked exactly as they did on the 450.

The LCD display reminds me most of the IC-728. The numbers
are large and easy to read. The backlight is adjustable via
a menu selection. The meter is a nice compromise between an
analog movement and a bargraph, since the LCD segments are
laid out in a radius, resembling an analog movement. This
is a simultaneous
S meter, power level, SWR, Compression level and ALC. It
looks like the audio level function in the 450 was left out
of the 570 meter. The peak hold function works well. (2
segments remain at the peak level for about .5 secs.)

The front panel is well laid out. It's exactly the same
size as the 450 but MUCH easier to operate. The location of
each of the buttons has been well thought out for operator
convenience or efficient contest operation. The buttons are
rounded rubber, not the squared off plastic and metal ones
on the 450 and 850 and 940. The buttons are divided into
groups depending on function. Each one of these groups has
a different shape and feel - a nice touch for the sightless
or sleepy contest operator who has his eyes on the monitor
and only his left hand on the controls. The buttons work
easily and don't take much effort. This was annoying to me
on the 706, Delta2 and Omni6 which take entirely too much
pressure to make contact. This is an important point for
contestors.

Joe pointed out that a "reminder" LED was missing from
functions like notch (beat canceler and noise blanker)
although the LCD segments for these functions are of good

size and difficult to miss.

The receiver was compared side by side to my 450. Without doing extensive lab tests with a signal generator, it's seems that the receiver is somewhat more sensitive yet quieter from phase noise. I didn't seem to need the pre-amp in situations where I needed it with the 450. The Noise Blanker seemed effective to pulsing noise and compared to the 450, did not cause the usual distortion on strong signals or strong adjacent signals.

IF shift control works well and I'm please to see it with a center detent, like the 450. I tend to leave mine a few degrees off center which seems to emphasize the lows of a SSB signal, making the signal sound "full".

The memory channel selector knob doubles as a menu selection control. The following functions are not controlled by the menus but can be individually controlled with this "multi" knob: mic gain, pwr level, keyer speed, vox/break-in delay, and bandwidth selector.

The menu function is extensive, yet fairly easy to use. It is similar to the 450 and 850 but has an alpha numeric scrolling display describing the function so you don't need to constantly refer to the manual. We were able to set and control most of the menu driven functions for the first time without referring to the manual.

The DSP function is in both the transmit and receive audio circuits, not in the IF like some of the other radios currently on the market. There are advantages and disadvantages to both techniques and Kenwood has chosen to put it in the AF. I think this was good choice, although I haven't compared it to an IF DSP radio. The complaints I've heard about transmit and receive audio distortion in the 870, appear to be non existent in the 570. Both transmit and receive audio are clean and non-distorted. Even with the DSP beat canceler or DSP Noise Reducer functions on, receive audio is still clean, although it is possible to hear a hint that the audio is being "processed". There is no comparison though to the distortion introduced in the audio through the low end Radio Shack DSP unit. There are two NR selections. NR1 and NR2. One is used normally for SSB and the other for CW. These tend to reduce background "hiss" and is a separate function from the Beat Cancel which works well on SSB. Kenwood could have had the NR1 and NR2 functions automatically selected depending on mode selected, SSB or CW. I don't know why they didn't do this. I'm mostly a CW operator and the NR2 works well but may not be that pleasing to listen to while copying CW at over 40 WPM. There is just a hint of rising edge distortion as the DSP

does it's work. What is impressive however, is the "hiss" reduction with the NR function enabled. The receiver is almost completely quiet except for the desired signal. It would be interesting to compare this DSP with one of the high end external DSP units. The Beat canceler does a fine job of eliminating heterodynes on SSB and does not add any objectionable distortion to the received audio.

The CW tuning is cute, but I'm not sure how often I'd use it. Perhaps new operators or contestors would find more use for it than I would. I suppose my ear has enough training and experience where I don't see that it's necessary. It is not as precise as I thought it would be as it usually comes within 10 or 20 Hz of the correct frequency depending on signal strength, QRM or keying speed.

I installed the 8Mhz, 500Hz CW filter in my radio. It appears that there is only one spot for this additional filter - I would not be able to install a 1.8Khz filter with my CW filter installed. I don't see this as a problem since a combination of the DSP slope tuning and the IF shift does an adequate job.

On CW, the IF filtering works well. There is a filter bandwidth control that controls the DSP AF bandwidth. The DSP bandwidth is variable from 2.0Khz to 1.0Khz, 600 Hz, 400, 300, 200,100 and 50 Hz! The resulting combination of 500 Hz IF filter and DSP AF filtering reminds me of the Jones Filter arrangement that Ten-Tec put in their Delta2 transceiver which was continuously variable from wide down to less than 100 Hz. I found it difficult to find a crowded portion of the band where the 570's IF and DSP AF filtering could not effectively knock out adjacent interference. Compared to my 450 which had both 8Mhz and 455Khz, 500Hz CW filters, the 570 seemed to be cleaner with less "ringing" while copying CW at narrow filter settings.

The automatic antenna tuner seems to do a good job of matching the radio on any band to my 80 meter dipole fed with ladder line through a 4:1 balun, although the 450 never had a problem either. The "AT Tune" function is different than on the 850 and 450. Kenwood saved the "Auto/Thru" button and put both functions on one button. Depressing the "AT Tune" button toggles the tuner on or off. Holding it down for longer than a second, starts the tuning cycle. The tuner sounds much different than previous Kenwoods. Rather than hearing the whirring of a motor, it sounds more like a relay chattering. It took some getting used to. I'm curious what they did different with the tuner that makes it sound like this. The tuner, like previous radios, memorizes settings for each band.

On Pactor, Amtor and RTTY, the radio performed well. The variable bandwidth of the DSP filter is a nice feature when operating on the digital modes to knock out any adjacent frequency QRM. On transmit, I was able to operate at 100 Watts key down on long FEC and Baudot transmissions with no temperature excessive rise. The radio seems to handle this 100% duty cycle operation. A nice feature for the digital modes are menu selections to vary BOTH the audio input and output from and to the TNC.

On CW, the 570, in my opinion, is the best Kenwood yet that I've operated. My criteria for CW operation is mainly how smooth the transmit to receive transition is, how smooth the sidetone sounds and any audible noise or clicks from either the speaker or relays while on QSK or semi-QSK. The amplifier keying relay is easily enabled or disabled via a menu selection and with this relay disabled, the radio is very smooth and quiet in QSK. During QSK, you have to strain to hear a small, perhaps reed relay. I heard very little, to no difference in another receiver while switching between semi-QSK and full break in while sending a string of dits at 50+ WPM. This is a test that Joe and I usually run to see how good the QSK operation is and essentially duplicates the CW dual trace scope photo you see in the QST rig reviews. On QSK, I would rate the 570 second only to the Ten-Tec Omni 6 for silky smooth QSK operation and nice sounding CW on receive.

Although the AF output stages are spec'd at 1.5 Watts for the 450 and 570, the 570 seemed to have somewhat less audio drive into my external speaker than the 450. It's not a problem since I never seem to run the audio gain up less than 10 or 11 o'clock . The audio quality on SSB and AM was clean and comparable to the 450.

We ran a number of transmit audio tests on 75 meter LSB. Using a Radio Shack Highball mic, the consensus was that "High Boost" transmit audio equalization, and the mic gain at 40, seemed to work best. A half dozen critical ears on the frequency preferred the 570 over the 450 for transmit audio quality.

I'd be interested to hear from other 570 users and will try to answer question from others who may be interested.

Here is something copied from a web page...

Unlock the RIT on the HTX-100
"XIT-IT"

I've had a lot of fun working DX from my car with this rig. It is
one of the easiest to modify, if you
want to unlock the RIT. One of the major drawbacks with a rig of this
class (HR-2510,HR-2600,
HTX-100) is the tuning. There are usually 4 step sizes used when
tuning to the desired frequency.
(500 kHz, 10 kHz, 1 kHz and 100 cycles). The 500 kHz step is rarely
used. Its main purpose is to
move you from one part of 10 meters to another. For example, if you
are in the CW portion of the
band and want to move to the SSB end, this switch is handy. The 10
kHz step tuning can be used
when looking for contacts but you skip over most of the band. The 1
kHz step isn't too bad, but if
the other station is 1/2 kHz off frequency, you'll have to switch
over to the 1 hundred cycle tuning.
Even then, the station may be 50 cycles off from you. I always found
myself using the 10kHz step to
find a section of the band with activity, then switching to the 1kHz
step to pick out a 'loud one' then
switching again to the 100 cycle tuning to fine tune the person in.
Often times I still could not get the
station in just right, and there just isn't any other way to get any
closer to their frequency! Sure, you
can use the rig's RIT contol to tune your receiver right on, but then
your transmit frequency is still off
a bit since it doesn't move with the RIT control!

What's the answer? A simple modification to allow the transmit
frequency to move in sync with the
receiver frequency when using the RIT control. This mod takes only a
few minutes, is reversable (in
case you change your mind later) and really makes the radio a

pleasure to use afterwards.

Parts:

There are only 2 parts to this conversion. You'll need a 6 inch piece of wire and a 10k variable resistor. Any 10k pot should work fine.

Preparing The Radio:

To begin the conversion, first place the radio on a flat SOFT surface (the cases of these rigs seem to scratch easily) with the speaker side down, and place the rig so the front is facing you. Remove the top 4 cover screws and the top cover. Locate the radio's lamp light, and follow the white leads down to the green circuit board. Notice that one of the lamp's leads is connected to a point on the board marked as +8. Now look on the circuit board to the right of the +8 point. You should see a white jumper plug. In front of this and slightly to the left is a printed circuit board trace line. It is a straight line with a solder point on each end. If you have a volt meter take a voltage reading from this trace against the chassis ground. It should read near 7 volts. Mark down this number.

The Conversion:

Next, disconnect the power from the radio. Take the 10k variable resistor and solder the center tap lead of the resistor to the board at the +8 solder point. Next take the 6 inch wire and solder it to either of the two remaining leads of the variable resistor. Use a sharp tool to break the straight line trace that you had just found. Cut it in the middle of the line if possible. Then solder the free end of the 6 inch wire to the end of the trace closest to the front of the radio. The existing end solder point works nicely for this. This trace line originally provided voltage only during receive. Since the 8 volt source that we are now tapped into is there during both receive and transmit, the control will change frequency in both cases now.

Testing Your Work:

Connect the antenna and power but do not replace the cover yet. Now you have to reset the radio back on frequency. To do this, you can use a frequency counter, or a local ham. Set the RIT (now RIT/XIT) to the center OFF position and adjust the 10k resistor to set the radio on the correct

frequency. Have your ham friend transmit on a pre-determined frequency while you set the resistor
to tune them in. Another method would be to use the voltage reading that you took earlier, you can
just check the center tap of the resistor now and set the pot to the original voltage and you will be
close to the correct frequency. Once back on frequency replace the cover, screws, antenna and
power. At this point, let me inject a word of warning, your frequency display WILL NOT
CHANGE as you use this new RIT/XIT. So be careful around the band edges, don't get too close
or you may actually be out of band!

Now You're ready to see how much easier the rig is to operate. With the RIT unlocked, I generally
just leave the step size set to the 1kHz position, tune close to a "loud one'" and then just use the
RIT/XIT for the final touch up. You get about 1 1/2 kHzs on each side of the control's center. It's
great! Have fun and I'll see you on 10 meters!

I don't believe I have ever heard anyone refer to the 930S as a piece of junk except for the earliest models. ANything over serial number 3xxx will probably be ok.

IMHO it is still one of the best recievers around. If you do a bit of checking...ARRL Web page has a technical section that deals with radio comparisons...you'll find that it's still a pretty good piece of equipment. I just purchased a very nice IC 765 which represents a step up in reciever technology from the 930, and when A/Bing them, I found the 930 to be very acceptable.

There are a number of technical mods available for the 930 and any later versions..4xxx serial, will probably have them done, and the rest can be performed by any competent tech. They're well documented and easily obtainable from Kenwood and others.

I still like my930 alot. I think you'd find it a quite acceptable rig especially for the price they're now garnering...about 700 to 900 bucks depending on the filters and other goodies.

I think the best idea for you would be to consider the Hal
Communications model P38 PC plug in board. It will operate a very good
weak HF signal mode called clover. It also works PACTOR, AMTOR, RTTY,
and ASCII modes all in one. The board is easily upgraded by simply
visiting Hal's homepage and downloading their latest firmware upgrades.
The web address for them is http://www.halcomm.com. The price for the
P38 is only $299 while the sales event remains and is a very good
price. Then if you do get clover operating, come visit us all on
14.065.5 Mhz Lower side band!

To produce a birdie, not the fine feathered creature,
but one in the radio, the local oscillator and divide by
N PLL circuits genenerate products in the mixer which
produce upper and lower sidebands.

If you took a RF spectrum Analyzer and attached it to the
receiver 1st mixer in the downconversion process, you would
products of the sums and difference and products.

Some of these products do not need an external signal, as
sometimes they do indeed fall within the receiver passband.

In the case of the FT-50, I believe that the Local Oscillator
LO to RF Isolation is poor and that a product occurs as the LO
frequency passes thru the 146.73 to 146.76 range. It may be and
image frequency which may be the the result of 2 x Lo(freq) -RF
for low side LO injection. The image can also produced by
2 x LO + RF for high side LO injection.
Even with no RF signal present, a internal reference oscillator
along with the divide by N syth. unit can produce a product that
can fall within the IF passband.
These products, necessarily do not have to be produced by the
second harmonic, but could be a product of the 3rd, 4th, or 5th.
A receiver designertypicall does a spur analysis to determine
which products can fall within the IF passband of the receiver.
They can be quite nasty and dificult to remove, especially if
the receiver is quite sensitive.
An observation that I found quite by accident was that when
I put my FT-50R atop of my computer, it was really quiet. Usually
a 2 meter radio(HT) and a computer next to each other are not to
compatible. The noise floor is often obsercured by all the products,
tones, hash noise produced by the CPU, video boards in a computer.
I was amazed that the FT50R was quiet, the S-meter was not near
scale and I could hear packet stations come in on the FT-50R.
I tried this with my Kenwood TH79AD and Icom W32A and interference
was bad into both receivers.
I noticed I could detect the birdie in the FT-50R, only when the
computer was off, when it was on, I could not.
Hum,... I started to thing about the comments I heard from
friends that said they had less Intermod on their FT-50 than their
other radio's.
It appears the FT50R, has an type of AGC which affects the front
end sensitivity upon the presence of strong signals. These stong
signals may not be detected to you, but the radio knows.
As the noise floor rises, one may think the squelch would open,

as it does on the W32A and TH79AD. When it comes to the FT50R,
when the noise floor rises, the AGC kicks in and the birdie goes
away.
In a high RF activity area(strong signals), the end user will notice
less poping of the squelch, S meter will not goes as crazy to react
to out of band signals as it does on other HT's.
This is a novel approach to automatically adjust to the changing
noise floor and dynamics of the automatic leveling for the squelch.
This is a technique found in some commercial radio's out there.
If you wanted to get rid of this birdie, one could adjust the AGC
range, but the result would be lost sensititivity when the radio is
not in a heavy or strong RF environment. Instead of hearing signal
down to the -140dBm noise floor, it would be 120-110dbm, and the
birdie would be not heard. But the receiver may not be as hot due
to the reduced sensitivity. The leak around of the LO to RF of the
mixer may be just need another 10dB isolation to remove the birdie.
On will notice that when the antenna is off, the birdie is heard
stronger, this is beacause the RF front end is poorly matched and
this affects the loading on the out of band termination impedance of
the mixer, resulting in lower isolation, allowing the birdies also to
be heard stronger.
Anyway, these are my thoughts on the birdie issue and the FT50R.
I still think its the best radio out there in terms of sensitivity.
As a designer of high performance recivers, I can understand the
mechanisms of the birdie.
I hope this will help you understand if you are a technical
type. It may be harder for the appliance operator to grasp this
but the statements here are for educational purposes.

The subject says it all. I would like the matchin supplies for some Icom rigs I have. Specifically:

PS-20 (20 amp with speaker)
PS-55 (curent, small PS)
IC-3PA (old 3 amp supply with speaker)

This units must work and be in good cosmetic condition.

Please e-mail me with price/condition at mfeldmn@ibm.net

Hi and thx for reading. I have a GRC-109 for sale in auction at:

http://www.ebay.com/aw/item.cgi?item=fey2086

The GRC-109 is a set of small HF twins and a power supply. 10-15W,
covers HF up to 22MHz. GRC-109s were used primarily
by 12-man Special Forces teams in the field. A very nice set of
operating radios. More details at ebay.

I'm kind of in the same quandry right now. It is frustrating when someone calls me back on PACTOR and my TNC can't pull him out of the mud. Arrrh.

I don't know which way to go. Personally, I would like to get into DSP programming. So, that makes the DSP93 attractive. But, then I'm lusting after that last little molecule of performance.

I'm tempted to wait on this as my guess is that we're on the downward price curve DSP wise. And save up instead for a new scope and 440Mhz beam/transverter.

86. Problem w/TS850 noise blanker

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-02 00:00:00 UTC
From: Tim Hunt <WA6TNW@LVNEXUS.NET>
Message-ID: <32CC53EC.AC4@LVNEXUS.NET>
Source record: 187040

I am having a problem with the Kenwood TS 850's noise blanker's, and
wonder if a cure (mod) exists.
When the noise floor reaches to about S 4 to 5 region, and can be
reduced by using the noise blanker, and a moderately strong signal
exists within about 100 Khz. This signal will cause the noise to pump
up and down to the unattenuated level at it's cw/ssb rate.
I would appreciate any information on how to cure this.

87. FS: Tower, antenna, et al

All of the equipment is from US Tower Corporation.

You'll have to pay for removal and transportation yourself, from the
northwestern Indiana region.

Model No. Description Weight(lb) Orig. Price

--------- ----------- ---------- -----------
HDX-555 Self-Supporting Tower 870 2309.00
(Free-standing heavy-duty crank-up tower)
CX-3 Coax standoff arms 8 69.00
IV-16 Inverted Vee Arm 5 33.00
MDP-750 Motor Drive w/ Pull Down 185 1539.00
MCL-100 Limit Switch Package 7 389.00
TRX-80HD Raising Fixture 155 539.00
TB-2US Thrust Bearing for 2" Mast 10 89.00
with 2 Flange Holes

4967.00

Plus...an antennae from Mosley Electronics, Inc.

CL-33-M Antennae 425.00

And a reinforced steel base for the tower (350.00 + 150.00 labor)
Sum total of $5742.00 (w/o labor) originally.

All of this equipment is nearly unused, as the original owner passed
away before he could put it to use.

Asking $3000.00 OBO. Serious offers only, please. First come, first serve
basis on offers.

Email offers, or questions, to pumpkin@bilbo.bio.purdue.edu

Thanks. =)

It is a good investment to purchase a RJ-45 climping tool if you do
a lot of work around those new "Mike" jacks. I bought one for $30.00
from Radio Shack and it comes with a RJ-11 adaptor die. It comes
in very handie when I needed those custom made phone cords for those
phones around my house.

Also the advantage I find in those new RJ-45 type mike jack is that
I don't need the soldering iron any more to rewire some of my old
mikes. hehe... Good for the lazy people like me.

> The other thing about Icom, as much as
> they are my favorite brand is that they are not loud with a Heil mike.
> That and a few other things drove me back to Kenwood (temporarily, at
> least)

I never cease to be amazed at what drives someone to buy or not buy a specific transceiver. For example, whether or not it works with one particular $75 accessory.... It is, after all, the relatively crummy and low output Heil mic that is the problem here .. not the transceiver. Why let the $75 tail wag the $3000 dog?

In virtually any Icom transceiver, all that is required is to either remove or change the value of ONE resistor in the input preamp if you can't live without the Heil hype.

Make certain that your coax is properly connected, and that the end connectors, regardless of their type, are installed properly. Second, try it on something that doesn't generate a signal and see if it trips the breaker. Connect it to your car's battery and turn on the heater blower, head lights, etc. See what kind of load it can handle. Back in the shack, check your grounding if the above failed to solve the problem.

I agree wholeheartedly. The point was simply that there are enough ways to skin the cat that I can't imagine NOT buying any one radio because you might need to do a little extra (rig mod, preamp, etc.) to make it work with a mic.

Frankly, any good mic teamed with a parametric EQ will get you everything you want. The Heil is ok, too, although in my opinion most of the benefits are in the attitude of the talker rather than the S/N ratio of the listener. I will omit my usual editorial about how bad most radios sound with an HC-4 cartridge -- except to say that my own ham radio hell will be populated with hams running rigs with HC-4 elements and the compression controls turned to 20dB. :-)

To be fair, I have an HM-10-5, a couple of old BM-10's, a ProSet, an EQ-300 and a Heil boom. There must be a few ersatz 5 and 4 elements laying around too.

One of the very best (awful :^) sounding) DX mics is an old Icom HM-7 hand mic with a Heil element. This is a preamped mic, but differs from the current crop in that it is designed for a low impedance element. Since Heil achieves most of its tailored response by intentional mismatch of the element impedance (high) to the radio input impedance (low), you get a very potent "DX/contest" sound out of the combo.

But all of this Heil stuff is in a drawer somewhere -- well, I do still use the boom :-)

From: lmenel@millcomm.com
Message-ID: <5aglu7$4o3@misery.millcomm.com>
Source record: 187146

You should have no trouble with a little precaution and planning.

First. What kind of mobile rig do you have. It matters to some degree.
The later rigs have superiour noise blankers, and that really helps, even in a good installation.

Second. Grounding is a major key. Make sure to strap all the parts of the truck together. Use RG8 Coax braid. tap small holes or use self tapping sheet metal screws. Tie the bumber to the frame, the frame to the box, the exhaust system to the frame, hood to the frame or body engine block to the frame. etc. I know this sounds like a lot of trouble but it pays big dividends later.

Third. High quality ignition wires. Make sure they are suppressor type, double shielded and solid wire conductor. High quality suppressor spark plugs...ask at a good auto parts store for help. you may have to pay 40-60 dollars for a good set of ignition wires...they'll also help your engine run better,btw.

Fourth. Antenna. Make sure you use a good solid mount for your antenna. A ball mount of some kind, securely fastened to the rear bumber or on the side of the body. Make sure that the mount is grounded well and makes contact with bare metal at the mounting point and make sure the mount is well grounded to the vehicle.

Fifth. Enough coax. Run at least 30 feet of coax...I'm really not sure why this works, but in 15 years of mobiling, I have found it true over and over. Additionally, find out where your truck's electric fuel pump B+ line runs. Put some clip on style torroids on the line as close to the fuel pump as possible. You'll have to play with this after you install the rig. Also, be sure to run the coax from the antenna on the side of the vehicle OPPOSITE the fuel pump power supply line. It usually runs up the right side of the vehicle, but you'll have to check to see. Fuel pump noise can be an awful problem.

Good luck. I know these things work. You should be able to have an almost perfectly quiet radio in your vehicle...it just takes some planning and work.

I have a highly regarded handheld scanner for sale with full cellular reception capability. It is the Uniden BearCat 200XLT with cellular modification.

This is a 200 channel scanner with reception from:

29 to 54 Mhz
118 to 174 Mhz
406 to 512 Mhz
806 to 956 Mhz (with no gaps, including mobile cellular and cellular tower frequencies)

Features include weather scan, priority, search, light, keypad lock, lock-out, delay, and low battery indicator.

The price is $249 and includes battery and antenna.

Need info on a Yeasu FTV901R 2m/220/440 transverter that was part of a FT901D setup. Does anyone know what rigs will work with this w/o modifying cables etc. It has a 10m in/out I am told. Also what are the specs on this unit (pwr in/out etc) and is it tube type or what. Any comments for or agenst would be appreciated. Thnx WB5APD Bob

From: Rich Abbot <abbot@pez.bell-labs.com>
Message-ID: <32CC07FD.2671@pez.bell-labs.com>
Source record: 187167

I'll echo the other replies on this topic: The S41T is a good radio at an outstanding price. Its small size makes it a very easy radio to take everywhere, without thinking about doing so.

Nice battery life from the 3 x AA's, too.

The -one- thing I miss is a real antenna connector... the S41T has an inboard rubber duck with no provision for an RF output connector. So there's no way to use the lil' guy with an external amplifier or mobile antenna, things that can come in handy for a radio that puts out less than 400 mW.

Other than that, no complaints. A great deal!

Rich

I have two radios that I would like to program.

1. GE Phoenix SX. 16 Channel Model, Vhf-Hi, 25 Watts out.

2. GE MLS 8 Channel Model, Vhf-Hi, 40 Watts Out.

I am looking for any Info/software that will allow me to program up these units. I plan to move them both down to the 2-meter ham band.

Thanks

> Bob - N2YRJ

Hi Bob,

Although the IC-230 probably had one of the best receivers designed, the basic topology for frequency selection is, so-called, "crystalplexed"; i.e., a matrix of crystals all mixed in pairs for each channel. I would guess that the effort to move this radio down 1 MHz would not be worth the time/cost. However, you might try contacting Bob Morrow, WB6GTM, who authored an article on several modifications to this radio back in the 70's. I copied him on this message...

I'm seeking pieces and parts from the out of production vertical antenna line made by ESI.

ESI, or ElectroSpace Systems, now a divison of Raytheon (E-Systems), was also known by the trade name OMEGA.

The verticals used thick wall alum. and special ferrite matching and loading units.

The 2000C steering combiner used time delay via coax cables to 'steer' an array of verticals.

I am seeking the various base matching units, the 160 meter loading unit, the combiners, etc.

Check your junk boxes, and the garage! Let me know what you have, and what you think its worth.

A couple of years ago I was trying to locate a source of a very
similar device which was used in (I think) a Lowes SRX-30 HF
receiver. I tried all the usual OKI distributors in the UK,
including OKI themselves who fax'ed Japan for me, as well as
Lowes and Yaesu who both 'thought' they had some, all to no
avail. From what I recall being told by OKI, the various
equipment manufacturers all had different versions of the chip
mask-programmed to their specific requirements (IF offsets,
etc), so once the supply of a particular variant was exhausted,
that was it - finito, etc. They did offer to make a new batch
for me, but wanted a minimum order of (IIRC) 10,000!

Sorry to be such a kill-joy, but I don't hold out much hope that
you'll be able to find a supplier. Good luck with your search,
anyway.

150. Re: Dxers: is it really worth going to 1.5kw from 500 watts?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-02 00:00:00 UTC
From: BOB DUCKWORTH <bob@atl.org>
Message-ID: <32CBE9F0.19AE@atl.org>
Source record: 187182

Having been on the DX end of the pile up I'll agree with the
CW comments. Good operating practice always won out. In fact,
I'd work the good weak guys first cause the contacts went fast
and I didn't want to lose them if the band started to go.

Phone is funny. To my ear, a good clean signal is easier to
copy than a loud one. Well equalized, compressed, and
undistorted will stand out even if many S units below the
crappy signals. Again, good operators got worked first.

On the chasing end of things a good antenna is more important
than 5db of extra power. If you can't hear the DX through
the pileup you can't figure out what he's doing and it's much
more difficult to sound like a good op at his end.

I'm running 100W now to a full wave 80 meter rectangular
loop. Great on 80 and 40. A second antenna and some phasing
to kill some of the pile up noise comes next.

For 20 - 10, I could spend $100 on a trap
vertical and $1000 on a 1.5KW amp or I could spend $1000
getting a 2 ele quad up 50 or 60 feet. I KNOW I'll get more
from the quad and that's what's gonna happen this spring.

If you've already got some nice antennas, low loss feed line,
and a well tuned rig, the extra 5db might make a cost
effective incremental improvement.

However, for the same $1000, you could be DX for a week and learn
what it's like on the other end.

From: andrew@phicom.dungeon.com
Message-ID: <32cae6fc.0@news.flexnet.net>
Source record: 187207

Wanted :-

A Valve HF transceiver or valve separates. Must support SSB & CW and must cover 10 meters to drive some transvertors - AM might be usefull for conversion to FM, but not a priority.

Some names that spring to mind ... KW2000x or Drake R4C / T4C.
Any transceiver with an external power pack that would be capable of supporting another valve TXer (eg. 800V, 300V, 6.3V and -50 ish) would be of advantage.

The units must take 240V AC mains. Non-workers considered but must be complete and not too burnt !

I live in Ipswich, Suffolk, UK so its probably easiest for me to view if you live in England - pref S/E.

Thanks,

Andrew

From: longrigger@aol.com
Message-ID: <19970102011200.UAA27890@ladder01.news.aol.com>
Source record: 187210

I was wondering if anyone could mail me with some answers to the following situation.

I am an avid deep sea fisherman. I have found that the local Charter and commercial boat captains now do not use thier VHF radio to discuss fishing locations anymore. They call each other on their cellular phones. A friend of mine told me that if I could get an old scanner, that it would let me listen in to the fishing conversations and get the location of the hot fishing spots.

1) What are the frequencies that cellular telephone are boradcast in.

2) Is it legal to listen (not broadcast) to the cellular channels in the US?

3)What about or Canada or mexico?

4) What distance does the FCC laws extend off the US coastline? (I fish usually about 10-50 miles offshore)

5) If it is legal to listen to the frequencies offshore, then where can I buy a 12 volt scanner to mount in my boat that would get the cellular frequencies?

6) I already have an antenna mounted on my boat for my cellular phone. Can I use this with the scanner?

7) Will a hand held scanner pick up as well as a 12 volt permanent unit mounted in the boat?

Longrigger

>possible to program in a separate offset for one frequency only.
>Specifically, there is a repeater with a 1.035 MHz offset in S. CA. which
>I want to program in. Can anybody help?

If it is like my TH-77, just use an odd split. Put your Rx frequency in a
memory
[ENT][ENT]435.000[ENT][M][3][3]
to put 435MHz into mem. 33
Now put your Tx frequency into the VCO and then put it into the same memory
location, but hold PTT while you enter the numbers.
[ENT][ENT]436.035[ENT][M]<hold and keep holding PTT>[3][3]<let go>

The display should show [+-] above the frequencies. Key up and check to see if
the displayed frequency changes.

Dave.

Date: 1997-01-02 00:00:00 UTC
From: 1 <ACABAMS@WORLDNET.ATT.NET>
Message-ID: <01bbf85a35901240f07174cf@default>
Source record: 187216

Will the Yeasu FT8000 receive aircraft?

Are any mods available for the 8000?

Thanks.

Mike

You don't need any "equipment" per-se. In addition to the RF input, you
should also connect the ALC line and the Antenna Relay. If the TS-140S is
similar to the TS-430S and TS-440SAT, these lines should connect up with no
external relays or level conversions necessary.

>Longrigger

Longrigger;
First, what your asking to do is illegal. But if that doesn't discourage
you, the chances of actually capturing a call on your scanner would be VERY
slim. Unless these captains are ragchewing on the phone and chitchatting
for any length of time, the frequency range is large enough that it would
take time to scan the celluar freq. range.
Cell phones don't use just one freqency, they can change frequencies many
time during a conversation. The users don't know it or notice it, but the
computers do and anyone trying to listen.
You would have a lot to learn about scanners, celluar frequencies, and how

to put them together. I don't think you would ever hear what your looking for. Put your time into being a better captain yourself and learning the water, listening to a cell phone could get you in lot of trouble if the other boat captains find out and report it. It is a Federal law, not state or local.
Just one person's opinion, others may tell you go ahead. The law part is fact, the chance of listening is just my opinion.

The connector for that packet port is the same as a PS/2 computer keyboard
extender and/or adapter. You can get them at computer supply stores for a
couple of bucks. Cut off the female end and wire your DB9 or DB15 and your
done.

Mike,

Yes, the FT-8000R will receive the VHF AM Airband. I'm very happy with the Airband reception quality, but sensitivity does drop off a bit as you get closer to 110MHz.

Sorry I can't help with any mod details.

Chris,

Outbacker Antennas are made in Australia, now distributed by Alpha Delta Communications - they make a complete mount assembly (designed to mount onto a horizontal bumper or plate sticking out behind the vehicle) which has an SO-239 horizontally out of the bottom of the mount, and what I describe as a "hell-for-stout" spring on it. Amateur Electronic Supply (and other dealers) stock this mount.

180. 2 meter mobil rig on sale at Radio Shack!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-03 00:00:00 UTC
From: amrandin@aol.com
Message-ID: <19970103004900.TAA28870@ladder01.news.aol.com>
Source record: 187057

Radio Shack has the 2 meter mobil unit--HTX 212--on sale right now at $199. It's a great little rig with plenty of features like DTMF encoding and decoding. I bought one yesterday and found it to be a great little unit and very easy to use and program. The only bad thing about the rig is that it only has 30 memory channels. This year's model--HTX 242--has 40 channels and sells for a hundred dollars more. Overall, I'm very happy with it. With a MFJ 5/8 2 meter antenna at only $19.95, it makes a great base station for under $220. Not bad for someone on a budget.

What's up with the price of radios in general. They are just too high! For someone like myself, I have found the prices of new radios to be rediculously high and as a result have decided not to persue a HF licence or expand my interest in this hobby. Computer can be a lot cheapet and there's "NO CODE" required.

73,

Amran (KF6HAD) "A NO CODE TECH and that's as far as I'm going, and that's by choice"

Good deal! I heard the 212's are nice little rigs. They say the 242 is
excellent as well.

>What's up with the price of radios in general. They are just too high!

Ever think of buying a good used HF rig? A "decent" computer costs as much
as a new HF rig and where is the challange of communication using a computer?
The "net" is great and all that but there's no challange.

>73,
>
>Amran (KF6HAD) "A NO CODE TECH and that's as far as I'm going, and that's

192. PK900 with WISP for Sats??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-03 00:00:00 UTC
From: Charlie Rubenstein <rubenc@iglou.com>
Message-ID: <32CCA5EA.417F@iglou.com>
Source record: 187069
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I had WISP running fine with a PK96 TNC set as a TNC-2. I recently got a 9600 baud card for my PK900 TNC, and when I set it up to run in place of the PK96, NOTHING worked. I reset the TNC type to PK900, and even with strong signals, nothing appears on MSPE. I reset the TNC type to TNC-2, with non improvement. Does anyone here have a PK900 running with WISP?

WHAT AM I DOING WRONG?

Since you understand that it is against the law then lets get
on with the program!!
Most of the people who tell you not to do this are the same
ones who are doing it!!

Cellular 869-894 Mhz. Get a scanner that has programmable
serach bank(s) and set these 2 frequencies as the upper and lower
limits. Keep searching until you hear the conversation you want to
listen to. Late at night you have a good chance of finding it...it
just takes a little more time during peak time.
A good rule of thumb .....NEVER TELL ANYONE WHAT YOU HEAR ON
THE SCANNER.
Good luck.

200. Yeasu FT-8500 questions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-03 00:00:00 UTC
From: tnic <tnic@styx.ios.com>
Message-ID: <5aif87$8h3@nnrp1.farm.idt.net>
Source record: 187077

I have not seen much posted about the Yaesu 8500

While the Yaesu web site and lit lists the features
only the owners manual tells all about how to work all those features.

Is the rig easy to use. Are you using the mike with all the controls on
it? If so is it easy to use?

Are the programming features easy to use?

Does the programming so complicated you have to carry around a manual or
is it all intuitive or with menus.

Do you have any complaints or changes you would want on the raido (other
than price of course)?

Thanks I am looking at a second Kenwood TM-V7A or the FT-8500.

Longrigger (longrigger@aol.com) wrote:
: 1) What are the frequencies that cellular telephone are boradcast in.

The cell towers broadcast on 868-896MHz, thats your best bet.

: 2) Is it legal to listen (not broadcast) to the cellular channels in the
: US?

Absolutely illegal. Its illegal to manufacture or import into the
country any scanner manufactured after April 1994 that is capable
of receiving (or being able to be modified) to receive cellular.

: 3)What about or Canada or mexico?

I doubt it.

: 4) What distance does the FCC laws extend off the US coastline? (I fish
: usually about 10-50 miles offshore)

I assume they extend as far as any federal offense.

: 5) If it is legal to listen to the frequencies offshore, then where can I
: buy a 12 volt scanner to mount in my boat that would get the cellular
: frequencies?

If you want a new one you will have to import it from another country.
I believe it is legal to bring it into the country if it is considered
your personal property. If on the other hand you tried to get a foreign
company to send you one, that would almost certainly be illegal, and if
it were detected by customs they would confiscate it, and at best you'd
lose your money. Any radio that is already in the US (including cellular
capable ones) can be freely sold on the used market.

: 6) I already have an antenna mounted on my boat for my cellular phone. Can
: I use this with the scanner?

It's very possible the connectors are different, and so you might need to
buy some sort of converter, but other than that, yes, it should work
fine. Incidentily, a cell phone is often capable of acting as a scanner.

: 7) Will a hand held scanner pick up as well as a 12 volt permanent unit
: mounted in the boat?

The quality of the receiver determines this. Not all handheld radios are
equal, just as not all mobile radios are equal. In general, a mobile radio
will do better than a handheld, but some handhelds probably do better than
some mobiles.

: Longrigger

Personally I think this is somewhat juvenile. First off, I don't believe your basic premise. Cellular phones cost money to use, VHF radios don't. Further more, I have some difficulty believing a cellular phone would work reliably on the ocean, since they are limited to 3 watts, or 600mW on a handheld. Another question is why are you fishing? Are you fishing for fun or profit? If its for fun, I think this is way overkill, and would be complicated and silly. If its for profit, I think its highly illegal, and I think if anyone found out what you were doing (especially the other fishermen) you would be in DEEP shit (and your posting this, doesn't really help you too much). Your chances of even picking something useful up to begin with are pretty low, and you probably need to learn a lot more about radios and cell phones before attempting this regardless.

I haven't had the same problem. When the radio was set up properly for
one way crossband repeat, i tottaly forgot that I wasn't speaking
directly to the repeater. The radio is missing a function when it comes
to cross-band repeating, VOX vs. carrier detect for retransmission
activate.

Hi,
Recently bought a Argosy(non-digital) and it does not have QSK. It came loaded with all the accessories and mods. At first I thought the 'relay' accessory for using a linear was the culprit..so disconnected it. Nope. Now I'm thinking its the mods that were done. Has anyone found that doing the AGC mod disables QSK?? The reason I buy Tec-Tec is for QSK. No-one comes close. Before I ship it to TT..maybe someone has the answer?
Thanks for reading..

Source record: 187087

Will:
I bought one of the Comet CH-32 Miracle Baby antennas for my Kenwood HT. The size is incredible which is more than I can say for the performance. Without a doubt, this antenna is absolutely deaf. If you wanted to have a signal attenuator on your HT and it didn't come with that option, then buy the Comet CH-32 and your radio will be as silent as ever. I use the Larsen Kulduckie stout helical antenna and can hit repeaters with 30 milliwatts that I can't hit using three watts out with the Comet. What a waste of $50 Cdn. Wouldn't it be nice if something that small actually worked? I have heard that Diamond make a small antenna too, about the same size, but with vastly improved performance and a cost of about $60 Cdn.

In summary, I like the size but think the antenna works like a dummy load for HTs and is basically a waste of money.

If you pay $15 per month for internet access you'll spend $1800 in ten
years just for access. You don't pay anything to use the ham bands. A
good computer's about $2000 and you can get a real nice HF rig for that!
The computer will last about 3 years while you'll have the HF rig for
probably 10 to 15 years. Over ten years that's $7800 for the computer
and $2000 for the HF rig.

What else he is saying is that he has a few scanners in his stock that
he still has to hold for another week to see if the people come back for
them and if they don't they will go on sale. You have to remmeber that a
pawn shop works in more than one way. On thing they do is take stuff in
that people do not want anymore and sell it for a profit another thing
they do is to take stuff in as collateral for a small loan and after so
many days you either have to come in and make an interest payment on it
or pay the money back with interest or lose the item and alot of dealers
can tell if a person will be back for the item.

From: "J.Balch (K4JJ)" <jbalch@skycom.com>
Message-ID: <32CD763D.6BD7@skycom.com>
Source record: 187095

The 781 has few people willing to consider it new due to price and older technology. On the used market, they are not easily sold. They compare (used) close to the FT-1000D's, but are worth less. In the best of condition, they are not a $3,000 radio. I've owned one, and sold it in perfect condition about two years ago with matching speaker in the mid $2,000 range after trying for months to sell it at $3,000.

219. Info: IC-271 tone decoder

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-03 00:00:00 UTC
From: KI6QP <stuart@itron-ca.com>
Message-ID: <32CD65DF.A35@itron-ca.com>
Source record: 187096

Looking for information on whether the tone
decoder/encoder board was ever available for the IC-271.
If so what is the model number?

The standard IC-271 comes with a tone encoder but no
decoder. I need a decoder. anybody have one??

Yep.....I foresee the price of '781s dropping like a rock because the price was really only warranted by the "neat" display. While the '756 will not be the radio (from a features standpoint) that the '781 is, the price of a new '781 shouldn't be more than $1,000 over that of a '756.

We'll see. I am in the market for a "dual receiver" rig, but am getting a little tired or waiting and would buy a used '781 or 950SDX or maybe an FT1000D at the right price. The other thing about Icom, as much as they are my favorite brand is that they are not loud with a Heil mike. That and a few other things drove me back to Kenwood (temporarily, at least)

I think we, collectively, have enough experience to build a very very
good PC based DSP TNC. We can use a sound blaster board, we cheap PC, and
use of of the COM ports to make it look like a off the self TNC. This
way, it will work with other TNC software such as PacRatt or KaWin.

The PC configuration would look something like this:

- Sound Blaster DSP card
- 4 Megs of RAM
- Floppy drive
- One Serial Port

I would like to see it support HF Modes (RTTY, ASCII, AMTOR, PACTOR),
SSTV, FAX, VHF Packet, and also the satellite modes like BPSK.

Unfortunatly, I don't have that much DSP experience to do this or I would
have done it already.

If anyone is interested, lets start the project! I think it could turn
out to be very fun.

I'm willing to start a mailing list on my machine to kick of the discussions.

Thanks,
Kory

>I thought the P3D power output and antenna gain is high enough to
>allow the use of omni antennas on the ground. Is this not true?

P3D will have more power, but from what I understand that power will
be used to have more than one mode active at the same time, IE the
power will be spread over more bandwidth. So you'll still need at
least a minimum Oscar 10 class receiving station for most activities
near apogee. At perigee it should kick butt, but it will spend a lot
more time out toward apogee so you should plan your station accordingly.

One big advantage will be the 3-axis stablization it will use.
That means the gain antennas will always be nadir pointing.
The problems we had with O10 and O13 due to poor squint angles
should be gone. It won't have to switch to its omni antennas at
perigee. And spin modulation shouldn't be an issue either. This
will lessen Earth station requirements somewhat. I don't know
if omni antennas will suffice, though. The receivers on P3D
won't be any better than those on O13, so you'll still need a
fair amount of uplink ERP even with gain antennas on the satellite.
I suppose you could use an amp into an omni, but it seems to me to
be better to use steerable beams for both up and down links.

228. KWM-2 Gurus - Try This One

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-03 00:00:00 UTC
From: hoff@america.com
Message-ID: <5ajvvc$rgs@defiant.america.com>
Source record: 187105

Hi,

The KWM-2 loads fine on 40 and 20 (230 ma anywhere in the band) but not 80 meters. On 80 it loads as follows:

Freq 3.8 band MA SWR
4.0 80 2.8
3.9 120 1.3
3.8 200 1.1
3.8 3.6 band 150 1.1
3.7 100 2.5

I can understand it might not load right at the high SWRs, but it sure ought to load ok at 3.9 or at 3.8 when on the 3.6 band. The load control will help a little, but not much. Haven't been able to improve it with alignment. Any ideas or suggestions of things to try will be greatly appreciated.

Yes, there was a separate transverter called the FTV-700 which accepted
6m, 2m, and 70cm modules (one at a time). So, to have an operational
unit, you need the transverter mainframe and at least one module.

Source record: 187116

Let me save you the pain and suffering I had for the eighteen months it took me to figure it out (yes, I'm slow!).
Synopsis: the voltage regulator Vsense connection is picking up the RF, detecting it, and shutting the supply down. I've had this problem with ALL brands of PS, Astron, Tripp-Lite, homebrew, etc. And the handbooks don't supply designs around the problem either.
Cure: find the big white power resistor that's in series with the + or - output of the supply (as in, last thing before you leave the box--it's usually on the + side). There will be two *little* wires (not the big fat ones!) running from either side of that resistor to a (most likely) 14-pin DIP IC. If you apply RF chokes to either (or preferably, both) of those wires, you're cured.
The chokes can be as simple as a few turns thru a ferrite core. Beads may work as well.
Good luck!

You can crash the computer control on this
rig by doing the following:

1) On the VHF side, turn on channel memory mode.
2) Make sure TONE 'T' is on.
3) Press DTSS TWICE (like the instruction manual says).
4) You're hosed.

You can't even turn the rig off! The power indicator
will immediately switch to 'M' (for medium power) then
the 'ON AIR' transmit indicator will be on (no transmit though).

I reported this to Kenwood. They could care less.

Nice radio otherwise. Anyone have any mods yet?

The pros are the obvious freedom of a cordless headset.

The cons are great, in my opinion.

1)You can be listened to by other cordless phones, scanners, baby monitors and other devices. This results in no privacy.

2) If you live in an appartment or densely populated community, you can hear other handsets or headsets using the same frequency or channel you are on.

3) The batteries in the cordless unit can die with little or no notice. Nicad batteries have a fast "drop-off" and the time spent off the charger is limited.

4) In some cases other handsets or headsets can capture your base unit's dial tone and dial out on your line. This problem has been resolved with the newer models using security codes.

These problems become more evident in apartment dwellings where the chances of other having a cordless close to yours is strong.

I hope this helps you with your concerns.

Rich

I am looking for some 1.2 ghz radios Hts or mobile rigs.

I will pay reasonable prices for these radios.

Also in need of reasonably priced 1.2 repeater.

Please contact :

Noel Lozada N6JFO n6jfo@anv.net
Alex Fernandez K6BG k6bg@juno.com

> I have not seen much posted about the Yaesu 8500

I believe QST reviewed it a few months ago, the writeup was generally favorable, it had heigh makrs on the technical specs.

> While the Yaesu web site and lit lists the features
> only the owners manual tells all about how to work all those features.
>
> Is the rig easy to use. Are you using the mike with all the controls on
> it? If so is it easy to use?

I have the MH-39 mike, not the "joystick" original one (I think the MH-39 was introduced as it was more conventional than the original mike, which some seem to like and others hate).

It is fairly easy to use, but some of the functions like squelch and vol are on the same control, and you must change the function by holding down a button till it flashes (i.e. to go from vol function to squelch set) and that can be annoying. There is a rocker switch on the top of the mike to change memories in a band, handy.

Manual is well written.

> Are the programming features easy to use?

Reasonably so, I think, but the menu is sort of hierarchical, and you have to step up to a function group, then select the individual function within the group. The display shows the function selected. There are lots of things you can control.

> Does the programming so complicated you have to carry around a manual or
> is it all intuitive or with menus.

Menus, but some of the functions are a little hard to select, as I said they are grouped together in sets.

> Do you have any complaints or changes you would want on the raido (other
> than price of course)?

Yes, there is a high pitched noise in the audio you will hear easily on a remote speaker or headset. The factory has apparently modified the latest units out. Mine loses its control settings and current menu settings (it is 8 months old) and several others on the net told me they had same experience. When new, it would come back in exactly the same operation and menu mode at power up. I plan to send mine back and have them find the problem. The internal speaker sounds terrible. I use a small computer-type

8 ohm external speaker in base operation, mostly.

Some alt functions are shifted by a momentary button push, but a completely different function is enabled by a 2 sec push. Sometimes annoying to differentiate.

> Thanks I am looking at a second Kenwood TM-V7A or the FT-8500.

Some Kenwood rigs are notorious for intermod susceptibility. I do not know about the TM-VA. I have had many good reports on my signal with the FT-8500. It is compact and solid, receiver is sensitive enough to get simplex from the next county with an outdoor groundplane antenna.

I would suggest you also look at the FT-8000 as it seems to me it has some nice compromises and features at a lower price, kind of like the FT-51 vs. FT-50 HT. Kinda like a cost reduced refinement with a few less features, but similar basic performance. I have not tried the FT-8000, this is speculation.

The radio does not come with the remote mount kit, so if you plan to use the removeable faceplate, you'll have to buy it. DTMF decode is like $60 optional card (but it cross bands very nicely).

The price is pretty high. I paid $585 at the late great Oklahoma Comm Center (curse you, Tucker) and have seen it even higher. With the limitations I mentioned, it has been a nice rig - all the bells and whistles, strong performer. I find the alphanumeric display along _with_ the freq (both bands) to be highly useful, that was my main reason for buying FT-8500.

I'd try to find one that is a late s/n (mine is 5K090970, which means it was made in 9/95). My guess is you'd want one with 6 as the first digit...

The first two digits tell everything. The first digit is a number, indicating the last digit of the YEAR in which it was produced.

The next character is a letter. Take the position of the letter in the alphabet and subtract TWO (from what I've been told several times) and that gives you the month of manufacture.

> I am looking for the Kenwood (TS-690S) command for reading the S-meter
> of the radio from the PC.

Whoops! I don't have the manual with me, but I can tell you this. This command does NOT read the S-Meter, which is unfortunately the only meter I would care to read. When I tried to implement the "Read Meter" command, it would only return valid values (0-30) for the audio "dB" meter on receive, or for the transmit meters (SWR, ALC, etc).

There's a command to select one of the meters as noted above. The "Read" command consequently only works with those that can be selected via the "Select" command. Since the S-Meter is *Always* active, it can't be "selected," and hence it can't be read! Pretty dumb, huh?

KN6GA de VS6UE/W4

Bob,

I have a MFJ tunable DSP filter (B kind. It's at home and I don't
recall the model number). Without the acutal experience of any
other audio ASP filters besides the MFJ's, I think I can only speak
for what I feel about it.

For the sake of comparison, here is my setup at home:
IC-R71 with 500Hz narrow filter, 106' G5RV, and the MFJ tunable
DSP filter.

CW operation

I love the CW performance. It's VERY effective to seperate signals
that are only 25 to 30 Hz away! For moderate to strong CW signals,
AGC works very well and it can really make the sidetone pops out from
the noise. Extreme weak signals are hard to pull out. During a noisy
band condition, the narrow deep DSP filter has a constant "Ringing"
noise. This frustrates me a great deal. In situation like this, my
personal preference is to bypass the DSP filter at this point because
it doesn't do any good to my ears. Adjustable Noice Reduction is
acceptable for CW operation; nevertheless, it seems useless because
noise level reduces dramatically as bandwidth reduces. When
bandwidth is down further, the CW tone becomes very "Soft". That's
OK but I prefer a crisp tone instead. My overall feeling about this
filter during CW operation is 95% out of 100%.

AM operation

I don't like the setting that MFJ suggested because it reduces
readability. Due to the fact that my IC-R71's audio has an unusal
"Booming" sound effect, the DSP filter is better off configured to
use as "Slope tuning". That means the filter can cut out some of
the low audio frequency; hence, increases intelligibility. When

Noise Reduction is turned on, an unusal "Echoing" effect will be imposed onto the signal. I personally don't like that because it makes my life a lot harder to live. Overall feeling during AM operation is about 60% out of 100%.

SSB operation

Similar to AM operation. I use "Slope tuning" most often and it seems to be 90% to 100% effective when cutting nearby SSB signals. Again, the Noise Reudction feature will create an "Echoing" effect on all SSB audio. I don't use it very often. I can get very good reception by combining the use of the receiver's own notch and pass band controls. This filter does help some in SSB reception but not a whole lot. It can be very frustrating to learn how to make the filter to work the way you want it during SSB. "Band Pass" filtering is also available but it cuts down on both sides of the signal simultaneously. This's why I use "Slope tuning" most often. "2 Band Pass" filter option is a hard one to use (to me). Weak signal filtering is acceptable, but don't expect MFJ will help you really lower the receiver's noise floor and pull the weak signals out for you. My overall feeling during SSB operation is about 50-80% out of 100% depending on band condition.

Digital operation

No activity on these modes.

Other feature

Memory and preset for center frequency are very useful and not very hard to learn; however, you need to write all settings down on a sheet of paper for different memory settings (MFJ provides you with a form template). Otherwise, you will need to recall the memory by morse code. The speed of the Morse code announcement is internally adjustable.

Notch depth is internally adjustable. The "Manual Notch" is effective; however, the control knobs are shared with the "Band Pass" filter. This means you need to know what you are setting, and it confuses the hack out me. The "Auto Notch" sucks. Period. Use the receiver's notch filter instead.

Make sure your transever/receiver has enough audio output to drive the DSP filter. I have to turn the AF gain on my IC-R71 and the DSP audio input to full scale to get everything going. The IC-R71 puts out 2.0 watts and the suggested audio input for the DSP filter is 2.5 watts.

Overall, the DSP filter is a good to excellent product and it's a good add-on to your existing system (not if something else is batter). I think that there are three areas MFJ can improve on:

1. Noise Reduction Algorithm
2. Auto Notch filtering
3. Input sensitivity

With all those knobs on the panel, one should expect a little
learning curve as well.

WB5APD de VS6UE/W4

Hi!

I used to have one (1978 to 80?) and I loved it! It was my first HF rig! My FT-901DM was completed with an external VFO, digital readout on both VFO's, and the output was 100 watts. It's final has 3 (or 2? or 4?) 6146B's. The only mod to it was getting a pair of crystal so my brother could play CB with it. Yeah, a very nice CB with powerfule AM modulation punch!

I finally sold it to another ham and replaced it with then newly released IC-720A (1982?). Since it's been so long ago and that's all I can recall about the rig.

By the way, the radio was bought back by my brother in 86 (who is now in Hong Kong) for his CB venture. Last time when I visited him in 1990, the tubes were still putting out about 30 to 40 watts on CW! I replaced some new tubes for him before I came back to the states. I guess the radio still has years to come in its time.

265. Trouble with Yaesu GS800SDX rotor...

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-04 00:00:00 UTC
From: Vic <vgadzik@vivanet.com>
Message-ID: <32CF2EC7.4FBF@vivanet.com>
Source record: 186943

My new (about 3 months old) antenna system has started this problem:

When I rotate the thing with the rocker, maybe 20 degrees or so, then release, the antenna AND rotor box pointer swings back and forth about 2 degrees or so... I know the antenna is rocking back and forth, I've looked at it while the XYL move the antenna a bit and stops. It rocks back & forth about 5-6 times, before it settles down. I thought these had a "lock" that holds the antenna down when stationary???
Also, when I xmit on 2m (and HF), the antenna will move about 3 degrees, when keyed, then move back when unkey. I was thinking this was RF getting into the rotor cable (I bundled all the coax at the tower base with wire ties into shack - maybe I need to separate them???)

Antenna consists of:
10ft roof mount tower,
20 foot light gauge mast,
Force 12 beam about 6 foot above thrust bearing,
2 meter Cushcraft 13el mid way up,
440 cushcraft 3/4 way up,
and Diamond 6m/2m/440 vertical on top.

Anybody got any tips before I start to attempt to contact Yaesu???

Hi!

Thinking of buying a Maxon GMRS 210+3. Does anyone have any
expierence/comments with this radio? Also, where is a good place to
order one? Cheapest I've seen is $209.99.

Thanks in advance!

Andrew

Yeah, but if they're anything like Motorola parts here in Australia you'll pay through the nose for it. Motoroa RSS software here in Australia is all around AUS$650-700!! NOT including the programming leads (AUS$100-150) or RIB box (AUS$350+)!. They're approximate list prices, excluding sales tax.

> it? If so is it easy to use?

I use the FT-8500 mobile all the time. I have the standard mic which comes with the radio (not the larger optional one). I find it easy enough although it takes a little bit of learning. The functions I need to access whilst driving are easy. Anything more complex requires more attention but you (I) shouldn't be doing anything like that whilst driving anyway ;-).

>
> Are the programming features easy to use?
>
> Does the programming so complicated you have to carry around a manual or
> is it all intuitive or with menus.

I *do* carry the manual in the car but I rarely refer to it. It is all menu based and reasonably intuitive once you learn under which sub-menus to find stuff. The biggest problem is most keys on the mic have at lease 2 (and some 3) functions so learning the key-strokes to get through the menus took a little while. No problems now though.

>
> Do you have any complaints or changes you would want on the raido (other
> than price of course)?

The band switch button on the mic doubles as the power button (press momentarily to change bands, press and hold to switch off). It doesn't always register. Probably due to the multiplexing of the serial data from the uP in the mic. The knob on the front panel is more reliable.

There is a persistent but *very* low-level high-pitched whistle in the RX audio (~15kHz) which is probably uP noise. Most people can't hear it. I can but only when everything else is quiet. Apparently there was a Yaesu tech bulletin dealing with this.

It also seems to be more susceptible to ignition and alternator noise than other radios I've used. It really needs to be wired direct to the battery.

The first one I had suffered a microphonic VCO but that was replaced without question under warranty (the whole radio, I mean).

>
> Thanks I am looking at a second Kenwood TM-V7A or the FT-8500.
>
> tnic@ios.com

Bear in mind, I'm being really critical above. It is a great radio - probably the best mobile I've uses, notwithstanding the above comments. The receiver is excellent (possibly the best in the business) with very good pager rejection and great performance from *both* receivers on *both* bands. The memory channel arrangement is fantastic and the optional ADMS-2 computer-aided programming software is worth its weight in gold. I've also had only very good reports about the transmitted audio (far better than I expected). The cross-band repeat function works great too.

I'd take the Yaesu over the Kenwood any day (but that's just my opinion). Local ham magazine "Radio and Communications" also gave it an excellent review for its performance, especially up against the latest Icom offering. The reviewer *did* give its user interface a bagging but I disagree with him on a lot of it.

BTW, other users I've spoken to hear also like them a lot.

Cheers,

>Please write.

Hi Marcel,
Keep in mind you need an Amateur Radio license to operate one of
these. And you can be found by other Hams if they find you are
operating illegally. The reason why I say this is because it states
many times in the license study book that VHF/UHF is "line of sight"
communications.
I would consider getting a license, or using the new Family Service
band or some kind of avaiation freqs. But please don't use it
illegally (That is if you don't have a license.)

Chris,
I clipped the following articles from a couple of sites. I will be looking into this myself.

Title>PR33:Willco Electronics ICM-1024 Memory Replacement Board
Author>Kearman, Jim - KR1S
Source>QST Jul 94, p. 79
Abstract>A replacement board that owners can install themselves when the self-contained battery in ICOM models R-71, IC-745, or IC-751/751A fails.

Digest>The ICOM R-71 receiver, the IC-745 or IC-751/751A transceivers use a complex operating system held in volatile memory. It is maintained by a self-contained battery, but when that battery fails, the entire unit stops operating. Until now, the only solution has been to return the unit to ICOM to be equipped with a new battery!

Willco Electronics, owned by Jack Albert - WA9FVP, provides a plug-in circuit board that any ham can install on their own. It is only necessary to remove the bottom cover and replace the original memory board with the ICM-1024.

In installing it in an IC-751/751A, it is also necessary to add a wire jumper and remove a resistor on the new board before making the change.

The ICM-1024 board also contains a lithium battery to support the on-board memory. Owners can change this battery themselves. Doing so requires re-initializing the settings of the board, but it typically is done only once about every five years.

The replacement board also greatly expands the number of memories available in the transceiver. When bought new, there were only 32 in the transceiver. The new board provides up to 1024 memories for anyone who can think of how to use that many!

The ICM-1024 is available from the manufacturer at PO Box 788, New Lenox, IL 60451. Its list price is $150.00.

Article: 17580 of rec.radio.shortwave
Newsgroups: rec.radio.shortwave
Date: Tue, 19 Jan 1993 16:36:33 EST
Sender: Short Wave Listener's List <SWL-L@OHSTVMA.BITNET>
From: "David L. Wilson" <dwilson@S850.MWC.EDU>
Subject: R-71A Memory Notes
Lines: 25

I have heard that a new company named Willco is going to sell no fail
memory for the Icom radios.

Two models, one with 64 channels for around $70 and a 1000
memory channels for around $149 will replace the small battery
backup unit. The Willco board will use standard AA batteries.
When the batteries die in the Willco unit, the radio won't fail
and need servicing as is now the case. (However, the memories
would need to be re-programmed.)

Using the lock button and memory switch, one steps through the
banks of 32 channels each. One channel in each bank can be used
to store the channel number for display to identify the bank number
according to the maker.

Willco's address is P.O. box 788 NewLenox Il. 60451

If someone orders one, let me know what you think of it. I am not sure
which radios other than the R-71A in which it will work.

288. FT-50R FOR SALE and other equipment

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-04 00:00:00 UTC
From: kj7ho@aol.com
Message-ID: <19970104061400.BAA09917@ladder01.news.aol.com>
Source record: 186997

EQUIPMENT FOR SALE:
1). FT-50R Dual Band, (2-meter / 70 cm), Yaesu Hand-held radio. Manual, original box,
schematic diagram are included. Original Duck antenna and additional Premier RD-8
dual band 7 whip are also included. This is the High Power version (battery for 5 watt
operation), rechargeable with the wall charger. Receive from 76 Mhz - 999Mhz, with NO
intermod using the Premier RD-8 (I tested that out in downtown Salt Lake City, aka
Intermod Alley by local hams). Transmits on 144-148 and 430 - 450 Mhz. This little
radio is in excellent condition with not so much as a scratch on it and fully operational. It
fits right in the palm of your hand or clips to your belt. I love this little rig but need to sell
as we have baby on the way very soon and need the money. I am asking $285 and I will
take care of the shipping / insurance costs. Please email kj7ho@aol.com

2.) I also have an HTX-212 Mobile Radio Shack 2 meter Transceiver. This rig is in
perfect condition and fully operational. Have made excellent quality contacts on this rig.
Has 31 memory channels with 2 VFO s, CTCSS and DTMF transmit and memory. Has
all the functions of the bigger named brands and performs just as well as any of them.
Output, as called out in the manual is 45 watts high / 10 watts low, but I put a meter on
the rig and found output on high power as 50 watts. Unit comes with manual, schematic
and original box, just as if you bought it from the store. Please email kj7ho@aol.com,
once again, I am only selling it due to reason stated above. I have enjoyed using this rig.
Asking $260 and I will take care of the shipping/ insurance costs.

3.) For you QRPers, I also have a 30 meter CW homebuilt rig. This is Dave Benson s
NN1G, design from QST. Assembled and wired by me; tested and aligned by Dave. 5
watt mod installed by Dave when he aligned it. It is setup for the lower 30 khz of the

band. I also will include the RIT mod (not installed) parts. Schematic for the basic rig
comes with it. Asking $40. I will send you a copy of the QST article about it.

4.) For CW operation: I am selling my home built keyer. The enclosure for this keyer is
the Model 607 TenTec paddles installed in the box. I found there was a lot of room in
there, so I installed an Oak Hills Research keyer (Curtis chip) on a circuit board in the
TenTec enclosure. So now you have a single paddle, self completing dots/dashes with
on/off switch, speed control and tuning switch. Uses 9 volt battery, included. Will sell my
work of art for $30.

I will sell these items separately, but if someone will take all these off my hands, I will
include a 20 feet length of RG-58 coax with PL259 connectors on each end AND a bag of
6 mixed coax adapters (bnc to pl259, double pl259, barrel connectors, etc.)

Email kj7ho@aol.com with your desire to help me out. I would appreciate it.

Duane.

hello from Jim in Atlanta. All previous points correct,I've got some
experience with those too. I have found that the 900 mhz that use
spreadspectrum encryption work real well. You can be on hf running a k
with no rfi. The range is great,has the same charecteristics as our band
close by. Can be monitored,but they have to work for it! In my opinion
worth the expense. Good Luck KD4CDB

292. Looking for DIGITAL DISPLAY for DRAKE

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-04 00:00:00 UTC
From: Joe Fitter BV/N0IAT <joentam@transend.com.tw>
Message-ID: <32CE0AE5.228E@transend.com.tw>
Source record: 187001
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Hi,
I'm looking for a digital display for a drake c-line. Several were
made in years past by aftermarket companies such as Palomar, etc. I
also recall the "digital dial" by Atlas would work with the Drake line.
I also believe the outboard displays by Yaesu and Swan would work.

Please let me know if you have an old one lying around. I would like
a working unit if possible.

mailto:joe@the-stock-market.com

293. FT-50R Dual Band Hand-held and other equip for sale:

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-04 00:00:00 UTC
From: kj7ho@aol.com
Message-ID: <19970104081100.DAA12726@ladder01.news.aol.com>
Source record: 187002

EQUIPMENT FOR SALE:
1). FT-50R Dual Band, (2-meter / 70 cm), Yaesu Hand-held radio. Manual, original box,
schematic diagram are included. Original Duck antenna and additional Premier RD-8
dual band 7 whip are also included. This is the High Power version (battery for 5 watt
operation), rechargeable with the wall charger. Receive from 76 Mhz - 999Mhz, with NO
intermod using the Premier RD-8 (I tested that out in downtown Salt Lake City, aka
Intermod Alley by local hams). Transmits on 144-148 and 430 - 450 Mhz. This little
radio is in excellent condition with not so much as a scratch on it and fully operational. It
fits right in the palm of your hand or clips to your belt. I love this little rig but need to sell
as we have baby on the way very soon and need the money. I am asking $285 and I will
take care of the shipping / insurance costs. Please email kj7ho@aol.com

2.) I also have an HTX-212 Mobile Radio Shack 2 meter Transceiver. This rig is in
perfect condition and fully operational. Have made excellent quality contacts on this rig.
Has 31 memory channels with 2 VFO s, CTCSS and DTMF transmit and memory. Has
all the functions of the bigger named brands and performs just as well as any of them.
Output, as called out in the manual is 45 watts high / 10 watts low, but I put a meter on
the rig and found output on high power as 50 watts. Unit comes with manual, schematic
and original box, just as if you bought it from the store. Please email kj7ho@aol.com,
once again, I am only selling it due to reason stated above. I have enjoyed using this rig.
Asking $260 and I will take care of the shipping/ insurance costs.

3.) For you QRPers, I also have a 30 meter CW homebuilt rig. This is Dave Benson s
NN1G, design from QST. Assembled and wired by me; tested and aligned by Dave. 5
watt mod installed by Dave when he aligned it. It is setup for the lower 30 khz of the

band. I also will include the RIT mod (not installed) parts. Schematic for the basic rig
comes with it. Asking $40. I will send you a copy of the QST article about it.

4.) For CW operation: I am selling my home built keyer. The enclosure for this keyer is
the Model 607 TenTec paddles installed in the box. I found there was a lot of room in
there, so I installed an Oak Hills Research keyer (Curtis chip) on a circuit board in the
TenTec enclosure. So now you have a single paddle, self completing dots/dashes with
on/off switch, speed control and tuning switch. Uses 9 volt battery, included. Will sell my
work of art for $30.

I will sell these items separately, but if someone will take all these off my hands, I will
include a 20 feet length of RG-58 coax with PL259 connectors on each end AND a bag of
6 mixed coax adapters (bnc to pl259, double pl259, barrel connectors, etc.)

Email kj7ho@aol.com with your desire to help me out. I would appreciate it.

Duane.

294. ICOM IC-Z1A Scan Range

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-04 00:00:00 UTC
From: Mark T Rooney <DiznyGuy@Cris.Com>
Message-ID: <01bbfa11$5e9917a0$bcf0adce@crc3.concentric.net>
Source record: 187003

Earlier I had a key-press combination that expanded the capabilities of my ICOM Z1A. It was two or three buttons during power-up. My batteries drained, and now I'm stuck in the old 136-174 range. Does anyone know the override? I thought this was permanent.

Thanks

295. Lentini and NY Tax dept. Audit

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-04 00:00:00 UTC
From: Rick129@ican.net
Message-ID: <32cb2742.15306299@news.ican.net>
Source record: 187004

I recently got a summons form the State of NY saying I bought my radio from Lentini Communications in Conneticut and did not pay any sales tax. Therefore I have to pay tax and interest and penelties.
I recently Bought a radio from Lentini at thier store. They said they could save me money by selling it as a mailorder and not pay the NY tax. Recently I got a summons from NY tax dept to pay the tax, a $80 interest, and a $110.00 penalty. Thanks alot Lentini!!! If I have to pay this you really took me to the cleaners!!

If this is the case the cost of the radio went up $300 due to penalties and interest. I have tried to fight it, but it seems there is a law that allows New York to collect taxes from out of state mail order houses if they ship to NY and Lentinis is apparently coopereating to the fullest.

Nice to buy a radio froim someone who goes an turns around and causes that radio to cost another 15% becuase they are jerks. They could hzve charged me the tax up front and saved me the $60 in interest and the $95 in penalties. But instead I guess they just wanted to make a radio sale.

Anybody else thinking of buying a radio better reconcider if you are thinking of buying from Lentini. Anyone else have any similiar situations

Rick

Source record: 187006

I am running the FT-901D and have had a lot of fun with it. You want to make sure that it is aligned before oyu try and tune up tho.. The service manual will walk you thru it without any major headaches..

The down side is, you only get the "old" hf bands.. You will have to do without 12, 17 and 30 meters.

I use a Radio Shack HTX212 with a Kantronics KPC3 TNC to do 1200 bps
packet. Cut a 10BaseT patch cable in half to make the cable needed to
hook the radio & TNC together. Full power? No problem.
Intermod? There is a slight problem. Just close the squelch a little bit,
and it goes away.

Hi there-

These are the tubes I'm looking for. Most tubes would need to be new old stock, but some used types are OK when noted. n for new, u for used.

As far as pricing, depends on the brand/condition. This way I can pay top dollar and get the best stuff. Since I am looking for certain things to fill in holes in inventory, it will be substantially higher than what you will get from other dealers. Especially audio tubes. From 10% to double what Antique Electronic Supply and others will pay.

Or, I can trade if it makes sense. I also pay finders fees if you know where a stash is.....

A great place to look for low-voltage relay control and other mods and upgrades for both SB-200 and SB-220's is the nicely done website from Harbach Electronics. Kind of makes me wish my SB-200 needed something. The stuff looks pretty good, and they even have a decent price on Svetlana 572B's (matched at no extra cost, not that it matters much).

I'm looking for someone that has done the mod to the
Kenwood TM-V7A, I have the Kenwood Sheet ASI-0030

It talks about the new Tx-Rx Ranges:

VHF 142-151.995mHz Tx 118-174mHz Rx
UHF 420-449.995mHz Tx 420-470mHz Rx

Does the mod extend the tx range of both bands
more than the Tx ranges above?

Also wonder what will happen if the 2nd wire is cut?

>
Will,

The SMA-501 IS NOT the same as the miracle baby for the BNC radios.
They advertise it to be, but it is not. I did extensive testing of
both.

This seems to be the rating I came up with:
These are all 8" and shorter antennas. Range was tested on 10 different
repeaters TX/RX with multiple locations in a general area to get rid of
space diversity differences.

Best listed first:

Dual Band 727 Yaesu Antenna BNC
Dual Band Larsen BNC
Yaesu Stock Duck on FT50 BNC
Miracle Baby - BNC
Standard C508 Duck SMA

SMA-501 SMA (I've seen dummy loads better than this one)

The SMA-501 that I bought is terrible. It is not even close to my
miracle baby with a BNC-SMA adapter!!

Grant:

It may seem weird on the face of it, but *to be heard* is at least as important as bells and whistles. There is no Icom mike available that will compare to the Heil HC-4 element if you are a DXer or contester. I have not been "suckered" by Heil's two-bit hype or their backwoods company. I have just had lots of experience with Icoms and mikes and know what works. (read many many years, lots of Icom rigs, and lots of microphones)

It is not quite as "simple" to modify modern Icom rigs as some people believe. Pretty much all of the components on the audio amp board are surface mount. And if you want to do it right, you will put a variable resistor in parallel with the bias on the mike amp, so you can just yank out the mod when you sell the radio. That is easier said than done considering the size and delicacy of the components.

Hello All:

* For Sale *

Kenwood TS-850S/AT HF Transceiver

* Automatic Antenna Tuner
* YG-455C-1 CW filter (500 hz.)
* SP-31 Matching External Speaker
* MC-43-S Hand Microphone (New)
* Totally Mint Condition
* Instruction Manual included (of course)

This transceiver has been used very little and is in virtually "brand new" condition. It works perfectly. Serial number: 30500278

Price: $1075 and I will pay shipping UPS (ground) in the U.S.

If you have questions please email them to me or else you may call me at: (619) 562-5960

Thank you,

Davida - NI6X

There seems to be several of us here with similar problems..

Mine is a Pyramid ps-25 that is acting up. In my situation, only my HF
rig trips the supply off, and then ONLY if something else is connected
to the supply. I have attached non-rf loads to the supplies maximum and
have no problems. As soon as I connect the HF, all hell breaks loose.

>price. Then if you do get clover operating, come visit us all on
>14.065.5 Mhz Lower side band!

The only good thing on the P38 is its price.
The unit has not enough processor power and has low performance.
(see QST,I believe december). Its Pactor I mode and amtor mode is
rather poor compared to a number of other units.
If you really want clover I would consider one of the more expensive
HAL units. But for the same price you can buy optimum Pactor I and
Pactor II mode. look atSCS (http://www.scs-ptc.com/)
Again see QST.

I am looking for a working lower power repeater. VHF or UHF is fine. 10 watts or less is also fine..Something along the lines of a GE lookout repeater or similiar. I need it for the local RACES group and am paying out of my own pocket so NO $1000 repeaters please...If u have something drop me a note to DanN0FPE@AOL.COM

Thanks Dan

Hi,

A few years ago I purchased a CAT converter for my FT767, built in the head shell of the 25pin socket and made by JCom.

The interface was built around the Dallas 1275 chip and was powered from the 232 interface.

Does anybody know the whereabouts of JCom nowadays? or anybody else who makes a similar interface?

Basically I want it to connect either my AR8000 or Opto Cub to my PC.

TIA

The Australian-spec FT51R will *not* go above 470MHz (AFAIK). The new model Yaesu radios sold through the official importer (DSE) have custom PROMS specifically done for the Autralian market (since the FT-530, hence its TX coverage from 420-450MHz).

It isn't possible to make them TX out of band nor to extend the RX coverage by any programming tricks or hardware mods that I'm aware of. Sorry.

Mind you, I'm quite prepared to be proven wrong on this one ;-).

Sounds like the CPU crystal doesn't start. You can check if it oscillates
by listening on an HF receiver (your gen coverage HF rig?) for its carrier.
The signal will be weak so use a piece of wire as an antenna and hold it
close to the xtal (but don't make connection with it)

Other cause could be that the PLL is out of lock, but I'm not sure if that
would cause the display to go blank

Good luck

Loek d'Hont

Don't know what they pay for the 781, but the mod alone costs $4500 they
told me (without an additional remote controller board option which costs
another $1000)

So don't expect to get much money for your 781, they only use some boards
and basically built it up from the ground....

Still an interesting concept, though.

Hello All,

I just passed my no-code Tech exam and I am looking for an inexpensive (around $500 minus antenna) base unit to get started with (I already have a Radio Shack HTX-202). Other than used equipment, are there any transcievers out there that are good quality and inexpensive? I have been reading about the TenTec Scout and the offerings from MFJ. The Scout, in particular, looks appealing, but I don't want to buy the first thing I see. I'd appreciate any info from you long timers in the hobby on available rigs and inexpensive antenna setups that fit within or close to my price range. Objective and subjective opinions welcome! Thanks!

- Brian

>
> Leslie WD5BYQ

Look in the manual for mention of the FTV-700 transverter. It is a mainframe which is designed to accept (one at a time) 6m, 2m, or 70cm modules. The transverter has it's own RF gain control and a simple Up/Simplex/Down switch for repeater splits. There is also a bandswitch which to allow one to cover the complete 6 and 2 meter bands on the 28-30Mhz range of the FT-757GX. I forget what the 70cm coverage is.

If anyone is interested in purchasing one, I have an FTV-700 which I purchased about a year ago and have not used. I have all three band modules and original boxes and documentation. I have no idea what price to put on it.

I have the following items for sale or trade:

TPL commercial grade VHF amp 120 watts out with 45 watts in. In near new condition, still
factory sealed works 138 to 174 mhz FM only.....$125 shipped

HYGAIN Hyrange II 10 meter FM converted CB...works and looks great
$35 shipped

SSC DTMF decoder in excellent condition with horn honk option, includes hookup cable..
.. $35 shipped

Uniden APH-52 2 channel 5 watt commercial portable, with drop in charger, NO crystals
, fair battery, $45 shipped

Cirrus Logic VGA card, 16 color, works fine, pulled from my computer $20 shipped

AMI 486sx/33 motherboard with Intel processer ...640k no extra memory
$40 shipped
same thing as above with 8 megs of ram $85

AMD 486sx/25 baby mother board with daughter board, 4 megs ram, onboard VGA , PS/2
style mouse port , Ps/2 style keyboard , on board drive controllers, No I/O board needed
$85 shipped

I have the following crystals for the Midland 13-509 220mhz rig that are surplus to my needs. These crystals also will work in the Cobra and the Clegg 220 rigs.

Transmit Receive

222.32 223.92
222.36 223.96
223.28 224.88
222.70 224.30

I will take $7.00 a pair shipped
If you take all of them I will take $20.00 shipped

Let me know if any or all of these look like something you might use.

I also have the following VHF scanner crystals. These will work in any rig having a 10.7 IF

RECEIVE ONLY !!!!!!!
155.370 147.645 155.100 154.370 146.940 154.92

153.710 155.835 147.330 146.820 155.490 155.300
155.400
All of the above crystals are $2.50 each or $25.00 for all of them shipped
to your door.

I also have following 2 meter pairs for the older Kenwood, Icom, regency
ect 2 meter radios
using a 10.7 if
Transmit Receive
147.81 147.21
$7.00 a pair shipped to your door

Contact me in the following ways
Packet N0FPE@N0LBA.#CEMO.MO.USA.NOAM
EMAIL DanN0FPE@AOL.COM
Phone 1-573-449-3690 after 5pm central (PAY ATTENTION TO THE
TIME!!!!)

I am looking for the following for trades on the above equipment

KPC-3 with latest firmware and 100k mailbox
KPC-4 with software
Icom 2at with good batteries
8088 laptop with or without hardrive
HTX-100 in MINT condition with NO mods

If u have any of the above items and are intersted in trading for my
goodies let me know..

Could also be a cold solder contact at the low voltage regulator IC or
even a cracked diode or resistor.

Jim..

Several years ago I had the receive modified on my Icom 2SAT HT to allow extended receive. I would now like to have the transmit opened up so that I can use it in the 156-157 mhz range for recreational boating.

The guy that did the original work used to come to various hamfests here in the Southeast. Anyone know anybody that does this still and/or is it something I can do myself?

Thanks and 73!

Brian
You might look at the ADI rigs. A recent review in QST rated their 2
meter rig quite high. Priced 239.00 - 249.00, 50 watts, and most of the
FM rig bells and whistles. Check with AES and/or HRO homepages. They
both handle them.

347. RE: Maxon GMRS 210+3

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-05 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9701051608256391@atdbbs.com>
Source record: 186855

>>Thinking of buying a Maxon GMRS 210+3. Does anyone have any
>>expierence/comments with this radio? Also, where is a good place to
>>order one? Cheapest I've seen is $209.99.

I had the opportunity to test the 210+3 before it was released, and
write the following little piece back in late-1994:

FINALLY A RADIO DESIGNED SPECIFICALLY FOR THE G.M.R.S.
Clint Bradford

Maxon has just announced a new UHF transceiver designed exclusively
for the GMRS, and which has USER FRIENDLY multiple-repeater
capabilities. This model is not (like most other GMRS radios) merely
a reworked version of some other commercial model. This one has
features which are uniquely needed by GMRS licensees, especially
those who travel.

10-channel positions -
Channels 1 through 7: the seven non-repeater "interstitial"
frequencies (462 MHz only).
Channel 8: the 675 channel, user selectable from the front panel
for EITHER repeater or direct communications.
Channels 9 and 10: dealer programmable for any 2 of the other
7 PRIMARY channels, also front-panel selectable for either
repeater or direct communications.

With the front-panel repeater offset selection for channel
positions 8 through 10, this could actually be considered to be a
THIRTEEN-channel radio.

CTCSS tone-code selection: FRONT-PANEL USER SELECTABLE for ANY of
the approximately three dozen common tones plus another dozen
extended and "in-between" tones, fifty in all. The user can
quickly change the tone code on any channel. The capability to
change the code no longer requires access to internal programming
or the use of a special external programmer. It's all accessible
on the front panel.

Transmitter output power: Depending on the battery or power source,
from 2 to 5 watts output, with a low-power (1 watt) front-panel
selection.

This is the first UHF transceiver since the mid 1970's designed
exclusively for the GMRS with a repeater capability. It is also the
first GMRS radio EVER to include user-friendly, front-panel-
accessible multiple CTCSS selection.

==========

Drawbacks - Channels 9 and 10 cannot be programmed to 462.675 - like Channel 8. BUT - because the changing of the CTCSS tones is so quickly accomplished, it is no real problem.

"$209.95" is about right...expect to pay about 175-210 for them today.

Brian,

Are you looking for HF equip when you said you were looking at Scout
models? If you have a no-code tech ticket you could have meant UHF/VHF
equipment. Rick is right those ADI rigs are the way to go. In fact they
have ALL the bells and whistles or be like me, I buy only used
equipment. Check rec.radio.swap also. 73-good luck

355. Computers w/Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-05 00:00:00 UTC
From: "Dale M. Boresz" <dmb@harborcom.net>
Message-ID: <32D06971.6FED@harborcom.net>
Source record: 186863

I've been a ham for 30 years, but have been inactive for about the last 12 years or so until about a year ago. I see so many uses for a computer in the shack but I have one big question. How do you keep the computer and or monitor from interfering with reception ???

I set up a Pentium computer next to my ICOM IC-728 and can hear can hear all kinds of computer generated "noise" throughout the entire h.f. bands. Is there a trick to this? I ran the ICOM on a battery to rule out a.c. line coupling and still had the problem, so I know that it is radiated noise. Am I doing something wrong, or does everyone just put up with this added interference?

Sorry for asking what is probably a stupid question, but any help would be appreciated.

Thanks!!

Dale

Source record: 186865

This is the fairest, most honest way I have seen to share in the wealth of the world.!

Take five minutes to read this and it WILL change your life. If you want to know how to make thousands of dollars quickly, legally, and with NO CATCH, then keep reading.

The Internet has grown tremendously. It doubles in size every 4 months. Think about it. You see those 'Make Money Fast' posts more and more. That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, what's $5.00, I spend more than that in the morning on my way to work on coffee and cigs for the day. So I sent in my money and posted. Everyone was calling it a scam, but there are SO many new users from AOL, Netcom, etc. they will join in and make it work for you.

Well, two weeks later, I began receiving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, then BOOM. By the end of the fourth week, I had received nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking a similar chance with $5 of my own bucks. Not a big chance, I admit--but one with incredible potential, because $5 is all anyone ever invests in this system. Period. That's all Markus, Dave, or Dan invested, yet their $5 netted them tens of thousands of dollars each, in a safe, legal, completely legitimate way. Here's how it works in 3 easy steps:

STEP 1.
Invest your $5 by writing your name and address on five separate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill inside each paper, and mail them by standard U. S. Mail to the following five addresses:

1. Brian Truter - 101 N. Park Avenue - Springfield, IL 62702

2. J. Campbell - 1040 C Winners Circle - Bowling Green, KY 42104

3. Joost Walter - P.O. Box 259 - 2870-AG Schoonhoven The Netherlands

4. S. Thomas - P.O. Box 4945 - Tampa, FL 33677-4945

5. G. Del Buon - Horsekildevej 43 3 th - 2500 Valby - Denmark

STEP 2.
Now remove the top name from the list, and move the other names up. This way, #5 becomes #4 and so on. Put your name in as the fifth one on the list.

STEP 3.
Post the article to at least 250 newsgroups. There are at least 19000 newsgroups at any given moment in time. Try posting to as many newsgroups as you can. Remember the more groups you post to, the more people will see your article and send you cash!

STEP 4.
You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the Internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses. Yes, that's right, only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your name at #3 or 10,000 postings. Average return, 500 people= $500.

They make 250 postings each with your name at #2= 100,000 postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at #1 and you get a return of $60,000 before your name drops off the list. And that's only if everyone down the line makes only 250 postings each! Your total income for this one cycle is $55,000.

>From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through and repost this article everywhere you can think of. The more postings you make, the more cash ends up in your mailbox. It's too easy and too cheap to pass up!!!

So that's it. Pretty simple sounding stuff, huh? But believe me, it works. There are millions of people surfing the net every day, all day, all over the world. And 100,000 new people get on the net every day. You know that, you've seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. That's the key, and that's all there is to it. Print this out right now so you can refer back to

this article easily. Try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the bucks, and see what happens.

REMEMBER....HONESTY IS THE BEST POLICY. YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS! GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the bucks to the people already included, you will not get much. I know someone who did this and only got about $150 (and that's after two months). Then he sent the 5 bills, people added him to their lists, and in 4-5 weeks he had over $10,000!

Looking to purchase two(2) Kenwood radios 430, 440, or 850 with power supplies. Capable of operating on 11 meters. Reasonably priced. Locations perferrably in western Canada. Also interested in other leads. Contact at above E. mail address. Please leave name and home phone number or fax number.

369. YEASU FT50 QUESTION

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-05 00:00:00 UTC
From: 1 <ACABAMS@WORLDNET.ATT.NET>
Message-ID: <01bbfabc$daababe0$6d7174cf@default>
Source record: 186953

I have a Yeasu FT50. I performed the extended receive mod and have the following problems, any info on how to fix them?

-CTCSS opens to false signals regularly, even ones without CTCSS encoding

-Speaker lcd does not go one when a signal opens the squelch. Only when you push the monitor button.

Is any info on adjusting sensitivity via the keyboard available yet?

Thanks

Bob,

You should consider the JPS NIR-12. It does two kinds of noise reduction
at the same time PLUS adjustable bandpassfilters. I have tried the DSP-9
and the DSP-9+ (not the zx599), but I find the JPS unit much superiour to
the others.

..snip

I agree about audio quality with the HC-4. The piercing audio produced by a Kenwood with the "high boost" on and an HC-4 is not natural sounding. It isn't the thing you want for ragchewing (aside,perhaps, from the 75m wars) It's only good for being heard.

I can remember the W2 that was in the northwest US that was always calling "CQ DX...beaming Pacific, Asia"....blah,blah I think it was W2NQ. You always heard him on just about any HF band that was open during the late 80s. He had the world's worst audio, but it was exactly the kind that busted through pileups. He was running a crummy old '820 or something and a normal amp but his audio was all "doctored". Hard on the ears but I guess it got results.

See Ya

I agree, it is not a radio manufacturers responsibility the build his radio so it operates with some ones accessory, but the Accessory manufacturers responsibility to make sure his device works with the radio he advertises it will work with.

If I were building an accessory like a mic, I be darned sure it worked with the radio I was selling it to work with.

The IC-756 will be using the standard ICOM mics so the Heil mic will still need an amplifier to be used.

383. MOT Minitor II internal jumper question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-05 00:00:00 UTC
From: steve.peters@dartmouth.edu
Message-ID: <steve.peters-1302041210430001@ka3-73.dartmouth.edu>
Source record: 186967

Thanks for taking the time to read this.

I have a Motorola Minitor II.

Right now, the "beeping" volume is variable with the speaker knob.

I know I can change an internal jumper to have the unit do a "Fixed Alert/Variable Audio."

This will have the pager "beep" at full volume, and then open squelch and monitor at a volume set by the knob.

If you know the jumper, would you please get back to me?

Thanks and 73 - Steve

>Thanks

Press and hold the B+# buttons while powering up the radio. Continue to hold
these buttons for at least 5 seconds after you powered up the radio.

This setting should have remained, the radio uses an EEPROM for storage and
loss of a operational battery should not have caused you to loose the wide
receive reset. Now you will loose it if you did the total reset as described
in your radio instruction manual.

Can someone tell me what relay is used for the Remote Tape Output connector on the ICOM R7000? This is the relay that turns an external tape recorder on or off. I was told it is a OMR-109F but can't find this Relay number listed anywhere.

Is the OMR-109F a ICOM part number or a standard number?

Would apreciate any info on this Relay (part number, spec's, etc).

Hi Harold,
I've got a 1000MP which I absolutely love. I also owned a 1000D, but I'll tell you, as good as the 1000D was, overall I like the MP better.....more features, more flexibility. I haven't had ANY problems in the time I've owned it (4+ months) and would recommend it highly. I think that overall, it's the best buy out there.

Hope this helps!

Hello All,

I've recently acquried an Icom 230 2m FM Transceiver. It has an
accessory socket on the side - one pin labeled VFO input... Did
Icom ever actually make a VFO for this radio? Any info appreciated.
...and if they did, and you happen to have one collecting dust...

Thanks es 73,
Bob, N2YRJ

Look in the QRZ ftp site in the mods directory,
ftp.qrz.com

There is a wide-band mod and the CAP/MARS mod.
The wide band involves removing a surface-mount resistor.
It allows out-of band transmit on both bands as well as a wider receive.

73,
Phil

Turn off various components and try it. Or, better yet, turn off the monitor and check for noise (since that is your problem most of the time). Cheap monitors and cheap video cables can really do a number as far as RF goes, although the signal levels are likely to be small.

Also, see if your antenna is picking up the noise. Pull coax leads out, check grounds, etc. Any decent quality video setup, combined with good shielding, should not have this problem.

So what's the problem? Having the computer in the center console is
probably great for you in the grand scheme of things. Mount the radios
in or under the dash, run your coax off to the side and down the side
panel to the rear for the antenna, or to the fron cowl, or wherever.
Make sure you use good coax, and good connectors for proper shielding.
If this doesn't get it, form a shield around the computer with aluminum
foil and if it is a problem do the same with the wires running to it.
Ought to work just fine.

I posted material some time ago regarding the Webb Laboratories Education & Professional Partnership Programs, unprecedented opportunities through which every faculty member, graduate student and undergraduate student (alternatively for the PP program - each member of a working group of designers) can achieve true ownership, at school, home and on the job, of powerful electronic CAE capability. The EP and PP Programs provide general, graphical nodal circuit analysis, RF/microwave-specific analysis, unconstrained nodal noise capability and true 'floating' two-nodes-per-port definition. In addition, the EP and PP Programs include the industry's most comprehensive transmission structure analysis/synthesis engine as well as the powerful SystemPlus suite of design tools for the wireless/receiver/system designer.

The complete EP or PP Program package, including over 500 pages of documentation, may be distributed department/group/consortium/company-wide with no restrictions, without expiration, and at no liability to the School, Group, Consortium or Corporation. EP/PP Program details, an editorial review and a growing example library may be found at:

http://www.webblabs.com/ep.htm

or

http://www.webblabs.com/pp.htm

I ask that you forward this announcement to potentially interested individuals. If you prefer, kindly reply with names and e-mail addresses of those to whom I should convey information directly. Thank you for taking the time to consider what has become a unique access and ownership opportunity for a great number of designers worldwide.

Wishing you a Happy New Year!

Brian:
I think you are suffering from 'Tunnel Vision'. Please put on the Wide Angle Lens and see the whole world! The FCC does not dictate to Canada, or any other country, with the exception of the USA, what bands it may use for communications. Do you think that the radio waves produced up here in Canada bounce off some invisible force field when they reach the 49th parallel? I don't think so. The 2 meter and 70 centimeter bands don't just belong to the USA and some congressman from the US isn't going to give a fat rats ass if I send him a letter from the Great White North anyway. I don't think I'm going to panic.
73s
Randy.
ps: I think its called the WWW... hmmmm... none of those 'W's stands for Washington, I guess they don't own the World Wide Web either.

Most likely problem is dust where the conductors are meeting the
display. I use canned air to dust off the areas prior to replacing the
display when I change bulbs.. If there's a smudge from fingers on the
display or dust pressed into the end of the conductor, use a very small
amount of rubbing alcohol and a LINT FREE cloth to clean and canned air
to dry. works for me.

Jim..

412. WTD: Manual to Lafayette HA-250 HF Amp

Newsgroup: rec.radio.amateur.equipment

----snip-----

It seems, after reading some of the stuff (not too technical :)) that
happened during the WRC-95(?), that Teledesic was already assigned it's
spectrum that it wanted and that bit o' spectrum was no where near the 2m
or 440Mhz bands. In fact it was in the Ghz region.

You do have a point about saving our 2m and 440 bands but Teledesic is not
the threat.

TTYL,
Mike

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-06 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9701072227506471@atdbbs.com>
Source record: 186801

>>Are the battery packs from any other radio compatible with the Radio
>>Shack HTX-202 HT?

Batteries are indeed compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

MAHA makes a great MH-BP-8H - 8.4v @ 1800mAh ... periphex makes a 12 volt monster for you... I regularly use the Quantum HAM Battery for all-weekend affairs.

MISCELLANEOUS NOTES: Some HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

422. How to transfer ADMS files to YaesuFT-50R ??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-06 00:00:00 UTC
From: jbrooker@usa.net
Message-ID: <32d066ca.7247793@news.concentric.net>
Source record: 186880

When I attempt to send an RDF file to the FT-50R, it hangs 52% of the way through and resets the radio.

Anyone know how to accomplish this successfully? Works great going the other direction (radio to computer).

Thanks

>>I just passed my no-code Tech exam...

Congratulations, Brian - and WELCOME to this great hobby!

>>...and I am looking for an inexpensive (around $500 minus antenna)
>>base unit to get started with (I already have a Radio Shack HTX-202).

Well, we really need a little more information, Brian! Because that measley <grin> little ole HTX-202 - when plugged into AC - delivers over 5 watts for me - which is more than sufficient for *me* to hit scores of repeaters where I live. (This is "cheating," of course, because I live in repeater-rich Southern California.)

Are you in the boonies? Large metropolitan area? What does your local Amateur Radio Club have to offer you? I looked up your name on the current (12/96) QRZ! Ham Radio CD-ROM, and you're "too new" for me to find out where in the country you are. Your BEST BET is to join your local Amateur Club! Let us know where you are - and we'll try to give you some good information!

I just recently purchased a 1000mp and like it very much. I have had an ft990, ts-870, and other rigs, but the 1000mp is the nicest sounding and easy to use rig I have had. There are some initial setup menus, but other than that a very comfortable rig to use

426. TS450/690S XMIT Frequency Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-06 00:00:00 UTC
From: Craig Compton <craigcom@sprynet.com>
Message-ID: <01bbfb8d$aceb8fa0$12d6aec7@craigcom>
Source record: 186884

Wonder if anyone has had the problem I currently have with my TS-690 or may have a Technical Manual for the radio to make a guess what may be wrong. The radio works perfectly on receive and in every respect except for the problem that I am about to describe. When the transmit frequency is set to a frequency lower than 74.88 Khz above the bottom band edge it transmits between 52.7 to 55.2 KHZ above the lower band edge. The rest of my description will be described in relation to 80 meters although the characteristics are the same on each of the bands.

Any setting below 3574.88 results in a transmit frequency between 3.5552 and 3.5527 MHZ. Changing the frequency (as indicated on the readout) causes the frequency to vary between the two extremes listed above. Tuning within this range seems normal - there are no jumps until the frequency reaches the high end of the range, then jumps back to the low end of the range or vice versa. Once the radio is set to a frequency above 3574.88 (3574.89) the xmit frequency jumps to 4177.8 KHZ then increases "normally" up to 4180.2 then returns to 4177.8 and increase again until 4180.2 is reached - then tre cycle repeats again.

If anyone can shed any light on this problem I would sure appreciate hearing from you. Hate to spend $70 for a service manual to find out that it is a problem that I may be unable to repair and will have to ship back to Kenwood anyway.

Thanks,

Craig Compton

Some things to try: Get the receiving antenna as far from the computer as possible. Try torroids on long leads coming from the computer. Make sure your station grounds are good and your antenna lead in shield is good. Try to improve the shielding in the computer. Different computers are better than others. My new Sony 200MHZ Pentium is much quieter than than the box it replaced, a 33MHZ 486. But even when you get yours quiet, then you can hear your neighbors computer....73

This is a rather bad way to say what you mean. An uninformed person
might think it's possible to plug an HTX-202 directly into the house
current instead of using a 12 volt D.C. power supply. Don't try this
at home, Kids. Spectacular fireworks will result.

430. Invitation & Collins Reflector goes fully automated

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-06 00:00:00 UTC
From: crippel@exis.net
Message-ID: <32d0930a.40259201@news-3.exis.net>
Source record: 186888

The Collins Collectors Association would like to invite those of you who have an interest in Collins Radio to subscribe to the now fully automated Collins Reflector. This service is sponsored by the CCA and is provided at no charge to Collins enthusiasts.

There is an FAQ which will hopefully be sent to each new subscriber when they "sign on." If you would like one and don't get it, drop me an E-Mail to:

crippel@exis.net

There may be a few initial bumps and glitches at first but we hope those of you who choose to participate will enjoy it.

-73-

Here are the instructions:

As of 1/6/97, the Collins Reflector will be fully automated and I will discontinue forwarding the mail manually as in the past.

The new automated list processor will be a real upgrade. It will enable you to get the material in nearly real time and does not require me to forward each message manually. You will get the material much quicker than before. The Collins Listserver behaves much like the Boatanchors list. Simply, you subscribe to the list, send it messages which it then "reflects" back out to all those who subscribe. This is done once every ten minutes.es.

You must resubscribe to the new listserver in order to continue to participate. The automated list server follows the same guidelines contained in the CCA FAQ. Please continue to follow those guidelines for posting and contributing.

Here is how to subscribe:

Send the following E-Mail message to:

LISTSERV@LISTSERV.TEMPE.GOV

Leave the "subject header" in the body of your message blank and in the body, simply type:

subscribe collins

The listprocessor will output an E-Mail message back to you with easy to follow instructions asking for your confirmation. At that time, you will be asked to send a second E-Mail message to the listserver. Follow those instructions exactly and send the

second, confirmation, message to the listserver.

If all is successful, you will be signed up to the list and a complete set of instructions will be sent back to you in the form of an E-Mail by the automated list server.

Finally, a very big thanks to Dave Kelly, AI7R and the City of Tempe, AZ who have graciously provided and set up the server. Dave and the Collins Collectors Association sponsor the Collins Reflector as a no charge benefit for Collins affectionados everywhere. Enjoy!

Yep, had exactly this problem in our review unit for our mag here in VK.
But wait, there was more: the same thing happened to the review FT-8000R.
Make sense of that. Very annoying problem, exactly as you describe it,
with data still intact. If it's any help, it did NOT happen with the

FT-3000, and it did NOT happen at all until after I had been playing
around with the ADMS computer control package. Do you have this suite, by
any chance?

We've done a full review of the IC-756 for publication in the March issue
of our mag -- and it's excellent value for money and works astoundingly
well. TX audio is surprisingly BBC -- needs a few more highs (heck of a
surprise for an Icom!)

I believe this scope is one that had a separate power supply chassis. It provided B+,filaments ,etc. It should have been provided with the scope. Tek made a couple of tube scopes with separate p.s. because they used so much power and space. I suggest that you put your money and effort into a solid-state scope like a 465.

The only problem with my FT1000mp was that the CPU xtal (around 25Mhz)
varies from rig to rig such that my first one doubled up to 50.150 or
there abouts. As I wanted to trnasvert to 6m that was no go. A
replacement now comes in at the top end of 12m but leaves 6m clear. You
don't need to be transverting to have this problem. The sprog is loud
enough to cause problems on any 6m rig in the same room. Why each
individual rig has a different cpu xtal frequency I have no idea. If you
want to operate 6m then select your FT1000mp from a few! Suffice to say
that Yaesu's response is that the rig was never designed for 6m even
though they have a transvert option and you can alter the frequency
display to show 50, 144 or 430Mhz. I still lose some of 12m even now.

Duncan
G4ELJ

The problem with being on the cutting edge is that you occasionally get
sliced from time to time....

> yingst@reddragon.com Harry, these rigs are programmed with the "GE suitcase "
programmer. The MLS may have PC software I dont know. You need to find
a ham friendly GE dealer who will do this for 20$ or so. I may have some
info on the EEPROM data for the phoenix if you have access to a standard
EEPROM blaster you could entered it by hand. I will look for this.

From: Jack
Message-ID: <32D0FCD5.66@sullivan.vf.mmc.com>
Source record: 186904

Do NOT take a piece of ham equipment to Trevose Hamtronics in
Pennsy and expect to have it repaired or even looked at within a
reasonable amount of time.
I droped my Icom IC275H off for repair to the S/rf panel meter.
(It doesn't work on either tx or rx.) This was on Jan. 2, 1997. I
was told that it would be 6 to 8 weeks before I would even get a call
about what would be needed to fix the problem. This is not a big
place with high-volume sales (used to be, years ago). I can't
conceive that their repair department is THAT busy. I did buy the
rig from them years ago and buy my major ham radio stuff from them.
My questions are:
1) Is this a normal lead time for ham radio repair shops?
2) Do I have an alternative for service (like sending the rig back to
Icom)?
The rig is out-of-warranty, but that shouldn't matter, IMHO.

From: Geoff Brown <equinox@itl.net>
Message-ID: <32D180D9.1CB@itl.net>
Source record: 186907

This posting fails to reach a point!
The IC756 is full DSP....new technology, no CRT..just LCD.
Production is much cheaper...
I have owned a 756 for the past month and think it's VERY gud, it knocks
spots off the 781, plus, half the 781 is a CRT!
nice radio that will hold it's price!

454. READ: 2M & 440 Band Threats - TELEDESIC SATELLITES

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-06 00:00:00 UTC
From: n5zgt@swcp.com
Message-ID: <5ar9o7$enr@sloth.swcp.com>
Source record: 186912
Cross-posted to: rec.radio.amateur.antenna,rec.radio.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.swap

Dear Fellow Amateur Radio operators,
Remember the ARRL bulletins from last summer warning us of a threat to our 2 meter and 70 centimeter bands?? Read on.
An article in the December 23, 1996 issue of USA today discusses the development of Teledesic, which will involve putting 840 loe-earth orbit satellites (LEOS) into orbit.
Keep in mind that these satellites are the beginning of the threat to our 2 meter and 70 cm (440 MHz) bands. If these things go up, we had better expect our 2 meter and 70 cm bands to shrink up, or even vanish. After these satellites go up, more companies will want their satellites in orbit and do similar things.
If you have not taken time to write your Congressmen, Representatives, etc. to ask them to help defend our bands, DO IT PLEASE. I am getting great cooperation from Sen. Domenici here in New Mexico. Get other Amateurs involved. Announce this at meetings. Sign petitions and send them to your government officials and to the FCC (WRC-97). But please be courteous when writing. Emphasize the importance of these bands for us (search & rescue, traffic handling, etc.).
These bands are extremely important to us, and we cannot lose them. Please do something and don't give up.
73,
Brian, N5ZGT

Very close. The receive frequency is stored with the [f][MR] then after
the tx frequency is entered, press [f][PTT][MR] (must hold PTT until MR
has been entered).
This is also useful if the RX/TX range has been extended to prevent
accidental out of band transmissions. On the VHF, you may set the TX
into the aircraft area, and the TX will be totally supressed. On the
UHF, I set mine to 446.0 simplex calling frequency.

459. Radio Shack HTX-242 - opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-06 00:00:00 UTC
From: kc5ng@dlep1.itg.ti.com
Message-ID: <5arirn$qt7@sf18.dseg.ti.com>
Source record: 186917

I'm considering buying the Radio Shack HTX-242 2m FM transceiver, and I'd like some opinions on its performance from current or former owners and users. I will be using it for voice only (no packet), and in my shack at home only (not mobile).

If you like it, don't just tell me "it's a great rig and I like it", because that doesn't tell me anything useful. Please, tell me WHAT you like about it.

Similarly, if you don't like it, don't just tell me "it sucks and I hate it". Tell me what you DON'T like about it.

Confine your opinions to the most recent model, the HTX-242, rather than the older HTX-212 (which I am already familiar with).

I'm sure someone will tell me, "Go read the QST review on it". I am planning to do just that, but I want other users' opinions also.

Send replies via email, please, rather than clogging up the newsgroup.

You don't need the software if you do the FREEBAND version of the mod.
It is a very handy addition and decreases you programing time but you
don't need it to complete the mod.
Just ignore all the steps pertaining to the software but when you do be
prepared to reprogram your radio.
Have Fun!

I've heard good things about the Radio Shack DSP-40, so I picked one up this weekend. The local store had one left for $26.95, which seemd like a good deal. The filter works great on CW, and decent on SSB. How does this filter compare to ones costing much more? How does it compare to something like the Kenwood TS-570? I'm using mine on a Yaesu FT-840.

10. The vfo should display 144.000 Press FW. (this step may not be
needed but
it worked for me)
Power off.
11. Powerup with lamp/ptt/knob held down. It should now be in tune mode
with
something new
(BAND= A 1) change it pressing the knob for 1/2 second and then turn
the
knob to FREE.
(BAND=FREE)
12. Power off and back on NOW RADIO DISPLAYS 50~540 590~1000 no gaps!!!
(Dont change any other function or you could screw up alot of
adjustments
here)
IT will tx where ever it locks. One radio 122~231 and 309~502 and
another
radio was
120-232mhz and 315-509mhz. This varies radio by radio.
Tx is only miliwatts near the edges (DONT TX OUT OF BAND!!!).
Rx locks after about 74mhz. it is very def in the 220 band tx is
miliwatts.
no tx above 502
but varies radio by radio.

13. If you have the ADMS 1 software you should have a copy of what was
in your
radio.before you started.
14. Copy from the radio. Save and name this file FREEBAND. This is to be
saved
as a clean copy for future use.
15. Copy from the radio again (or just copy the file) name this file
MERGE.
16. Merge the old file to this file and send to radio.
17. With your palms facing forward put your thumbs in your ears, wiggle
your
fingers and stick out your tongue at your Users manual while it is open
to page 10.
18. Then update page 10.

Dont make the FCC and Yaesu angry at you by trasmitting where you are
not
supposed to.

This information came from a Newsgroup message by Alan Judd, information
gained
from the Web Page at
http://members.gnn.com/hca/ft50/index.htm and my own attempts at
restoring the
radio using this

FREEBAND Mod.
Please give Alan Judd great thanks for subjecting his radio to T&E R&D
(trial
and error research and
development).

From: Bill WD2AEV <bkantz@monmouth.com>
Message-ID: <32D173F6.48AC@monmouth.com>
Source record: 186928
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,rec.radio.amateur.misc,rec.radio.amateur.equipment

The difference in the Mods are as follows:

The yellow wire mod will open up the recieve from 140 - 165 Mhz. This is acomplished by using the 2 meter bandpass filter. The rig will loose most of its sensitivity in the 60 - 140 Mhz Range. (6meters is not affected). By cutting the yellow wire you are leaving the 2 meter bandpass filter in place of the genral VHF bandpass filter.

Removing the caps mod actully corrects the existing badpass filter which now cuts out at 140 MHz to keep pager intermod out of the Broadcast FM.

By doing the caps mod opposd to the wire mod you get your full 60 - 180 Mhz coverage and have to live with some intermod in the FM BC and aviation bands (108 - 136).

The yellow wire mod is very easy and quick to get the VHF public service bands 148 - 165 Hhz but will kill most sensitivity in the FM BC and aircraft bands.

I hope this answers your questions

73,
Bill WD2AEV

Hello, and thanks for reading this. I have a '90 Isuzu Trooper
and would like to mount a couple of radios. The trouble is that the
computer is in the center console. I have called Isuzu and there
hasn't been any word on RF and the computer. There is little room
under or in the dash and it seems that all other driver-side accessible
locations are near the console. Any ideas, suggestions?

Thanks much,

Jeff

473. IC-229H Display Problem - help needed

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-06 00:00:00 UTC
From: k5esw@pobox.com
Message-ID: <32d17983.9592993@news.mindspring.com>
Source record: 186931

I changed the front panel lights on my ICOM 229H. To do this I had to remove the front panel and remove the LCD display. After replacing (soldering in) the lights, I was missing some segments in the display.

I reset the CPU but it did not correct the problem. I pulled the panel off several times and inspected my work, but still found no problem. The number of missing segments changes each time I take it apart.

I assume I am not getting good contacts with the LCD panel, but I do not see where the problem is. Anyone have experience with this?

I had this happen several times with my FT-51 with batteries that I had not used in while and I attributed it to bad battery contacts. Wiggling the battery around a little after reinstalling or carefully cleaning the contacts may help.

486. Kenwood TS-130* cooling

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-07 00:00:00 UTC
From: aswNS@hamp.hampshire.edu
Message-ID: <32d2b46f.0@news.hampshire.edu>
Source record: 186744

I had a Kenwood TS-130V and used it in a casual way for a number of years. This is the low-power version of the TS-130S. I liked it, but I decided I want a full power rig for times when I really want to be able to keep a schedule. Someone who wanted the 130V pointed me to someone who had a TS-130S for sale, and with his help a 3-cornered deal was worked out. My TS-130S just arrived today, I haven't even turned it on yet.

There is a problem with my new rig -- the cooling fan has been removed. I know it is thermostatically controlled, and the control includes transmitter shutdown if heat becomes excessive, but I am quite sure from the documentation and looking for ads from the early 80's when these rigs were new that the cooling fan wasn't an option, it was standard on the TS-130S. It is also quite obvious from looking at the unit that it once did have a fan; the tapped holes where the fan was mounted are somewhat roughed up.

I am a little concerned about the danger of damage and the possibility that I won't get top performance out of this rig without the fan. From the old ads I have learned that a few years later Kenwood released the TS-130SE with an optional fan. It appears the control circuitry of the SE is more sophisticated and power is proportionally controlled if the temperature rises too much. But with no former experience with these rigs, indeed, never having seen a TS-130SE, I have no idea whether the optional fan went with a larger heat sink, or whether there are other design features of the SE that make it less sensitive to overheating.

I would appreciate hearing from anyone with experience with these rigs who can tell me how much I should be concerned about the absence of a fan on the TS-130S. I think it will be easy to rig up a light or some other indicator to the fan power jack to let me know when it is trying to turn the fan on, and I imagine I can learn to run at a reduced power level that is safe. I can probably also mount some kind of surplus fan behind the rig. However, from pictures in the manual it looks like the fan was mounted on a plate that covered the back of the heat sink, and I presume this had some function in controlling the air flow. If anyone can help me locate an original-equipment fan with mounting plate for a TS-130S I would appreciate that, too.

You could mount an HF rig in the space where the glove box is. It is
easily removed. A small VHF tranceiver might fit at a slant just
in front of the console. Instead of using rigid mounting brackets, use
two pieces of stiff antenna wire on each side of the mounting holes of
the rig and run them down to the front screws that hold down the console.
That worked pretty well for me. I've not had any problems with my
on-board computer (yet).

Good Luck,
Tom Hogerty, KC1J
1988 Trooper Owner :-)

Brian,

Welcome to a great hobby. Don't get in the trap of thinking that working locals through repeaters on 2 meters or 440mhz (70 cm) is all your license is good for. I heartily recommend SSB "weak signal" work on 6 meters, 2 meters, and even 432mhz (70 centimeters). I put weak in quotation marks because when the bands are open and if you have a good antenna, signals can be quite strong. On 6 meters you can work the entire world when conditions are right, and during e-skip season, contacts between 500 and 2,000 miles are the norm during openings. I've worked as much as 2,450 miles on 2 meters. This is impossible on FM. (Read up on the nature of FM vs SSB, capture effect, and the fact that all the repeaters are on a limited number of channels.) You can also work the world via satellite with your license.

Unfortunately, all mode equipment can be quite expensive if purchased new. A Yaesu FT-690RII 6 meter all mode rig (FM, CW, SSB) costs about $700. The 2 meter version is a bit less. Don't rule out good used gear. The original version of the same rig (FT-690R) only puts out 2.5 watts (vs. 10 on the current 6m version, 25 on 2m), but can be run with a small linear amplifier if you need more power (which, with a good antenna, you don't!) and typically sells on the used market for $200-$275. Find an older used 2m SSB rig and a similar 70cm rig, add an antenna, and work the satellites! Make some friends in your local ham club who can help guide you on what to purchase, and can help you accurately judge the condition of used gear. Like any other group of

people, hams are MOSTLY honest, but I've met some real exceptions.

Unfortunately, most no-code techs never stray off the repeaters, and don't know what they're missing. Finally, learn the code! 5 words a minute is one character every 2 seconds. That's slow enough to think .- oh, that was an "A", here comes the next one. If you make the effort to memorize the letters you will pass. You would immediately gain 10 meter priveleges, and there are some very good inexpensive 10 meter rigs out there with which you could work the world. Then upgrade further, and enjoy the rest of HF.

Whatever you do, have fun. It's a great hobby!

73 and good luck,
Martin AL7OQ

A GE MVP would be perfect for what you want....10-20watts out, SMALL
package (stick with UHF though...VHF is small radio, BIG Cavities!)
and an MVP can be had for less than $150 with xtals included.

Not that your suggestions are not valid, I think positive intervention from all hams on this issue should be mandantory.

However, FWIW: In my numerous years as a ham, I have seen our bands increased not decreased. With the exception of early ham radio prior to WWII.

How do you think taking away any of our bandwidth would be enforced?

The FCC cannot handle nor do they care to, the one simple 11 meter band that has become a thorn in the radio spectrum.

Deallocating 2 meters from Ham use would open it wide up to CBer's and disgruntled hams all over the world and it will probably become as useless as 11 meters has become.
For less than 30 bucks, any earth based station could easily jam the weak signal produced by those Commercial low orbit satellites.

I see any intervention by the government in deallocating the current spectrum assignments as opening pandora's box and obliterating the entire radio spectrum as we know it. And literally losing what little control of it they now have.

The entire radio spectrum will become one big 11 meter band, that he with the most power dominates, even if it means ruining it for everybody else in the process.

The government can't own what it can't control. How can they sell something they don't own in the first place.

Think about it!

DON'T PANIC!

Teledesic is not one of the "Little LEO Operators that are after 2m and 440. They are a "Big LEO Operator" (hence the financial ability to put up 840 satellites) who already have spectrum assigned, and it's not the ham bands.

BTW, if I recall correctly, The Bill Gates is part owner of Teledesic, which sparked some negative comments due to misunderstanding early on in the fracas.

From Tim;
The TEK 551 (dual-beam) should have a *seperate* power-supply unit, which
is connected via a cable to that 16-way plug on the 'scope. The EHT for
the CRT is generated inside the scope itself, but the other voltages are
provided by the power-unit. If you don't have this, then it's :-(
unless you can find one.
regards

N5ZGT de VS6UE/W4 K

How would satellites that are supposed to handle high volume traffic
sattle with narrow bandwidth like our precious 2m and 70cm?

Analogy:
Amateur HF RTTY cannot be over 300 bps but in the VHF area can
go as high as 19.2 kbps. Why? BANDWIDTH!

To accomodate high speed internet traffic, T1 (1.544 mbps) is already
getting tighter as hours go by. But Satellites are talking about T3
or even bunch of T4's (if there is anything called T4). How much do
our 2m and 70cm get to offer?

Don't worry. It seems to me that the microwave regions are more likely
to be where they get the bandwidth from.

73!

Randy,

While the original post was directed to a US-centric audience
the band threat is a worldwide issue. The LEO providers are
attempting to gain additional spectrum via the next WARC. So while
writing to a US congressman might not help much a letter to your local
legislator won't hurt a bit.

All I can add to this subject is this...I know of one old-timer nearby who sent a Kenwood down there for service more than once and both times ended up with a bill that would make your eyes spin. A second local I know sent his rig down (another Kenwood) and layed out big bucks although not as bad as the first guy. Lead time aside, be prepared to have your wallet flattened quickly.

Harold:

I've talked with about a dozen hams running the ft-1000MP. The reports all agree: the owners love the FT-1000MP.

They sound great on SSB, too.

I've bought a few items from pawnshops (albeit many years ago) and they always gave me a receipt stating description, model and serial numbers. These were on store receipt forms, and like most stores, did not have any signatures, but sometimes the initials of the salesclerk. I never ran into any situations where the receipts were needed.

I have used the Antron antenna on 15 and even 20 meters with a MFJ949 tuner with excellent results. It produced consistent QSO's stateside and when conditions were better than average, many DX contacts. It certainly is not the ideal antenna system for DX, particularly on the lower frequencies, but it worked for me! 73. Brian

531. Kenwood V7-A WARNING!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-07 00:00:00 UTC
From: rbarnett@traveller.com
Message-ID: <5aspul$g5i@tsunami.traveller.com>
Source record: 186816

The new Kenwood V7-A DOES NOT HAVE SUB-BAND MUTING!!!

I had held off buying a new dual-band mobile for over a year, I was waiting for Kenwood to release a new mobile with alphanumerics. When I saw the first product announcement for the new V7-A, I put money down on the radio (sight unseen, and price unknown) at my local radio dealer, just to insure that I received one of the FIRST of these new radios...

I was completely thrilled with the radio for the first week I had the unit, except, I could not find any mention of sub-band muting in the manual. I asked my local dealer, and we went through instruction manual, page-by-page. No mention of this feature anywhere in the manual. My dealer called Kenwood, they looked and apparently returned with the response of "gee, we hadn't noticed that the radio was missing that feature....."

I then sent email to customer service, explaining the importance of this feature, and that I really need this feature in a dual-band radio. Their response was that of "we know it is a missing feature, but the other features of the radio should overshadow this "minor" shortcoming...."

Now if you haven't caught on to my problem, sub-band muting is the capability of the radio to mute the "other" band on the radio when you are monitoring a transmission on the band you are listening to... Therefore you can have a conversation on VHF, and while you're listening to a reply on the VHF frequency, you can be scanning UHF. When a signal is received on the UHF band, it will be muted to a low level as to not interfere with your main channel that is receiving audio at that time.

Without this feature, a user is forced to turn the volume up on only one band at a time, or listen to garbled audio when audio is present on both bands.

My Kenwood 732 has this feature, so do 733's and most any other modern dual-band mobile that I can think of....

The lack of this feature made this radio COMPLETELY useless to me, as I desire the ability to scan both bands simultaneously and not have to deal with the garbled audio that occurs without a mute circuit.

Therefore, I returned the unit to my dealer. Of course I had used the radio, and it was not the dealer's fault for this problem and they would have to sell the unit as "used." (I understand this policy as I work in retail sales, also... I had already put a few minor scratches on the unit, too...) My salesman attempted to get Kenwood to replace the unit for them, therefore, the dealer would receive full credit for this unit and be financially able to give me a full refund, also... Kenwood's reply was "that is why the unit has two volume controls"....

I had always been a HUGE fan of Kenwood Mobiles, I presently own the 733, 742, 241, 331, 441, and 541 mobiles. However, after this huge mistake of a radio, it will be a LONG time before I consider a new unit with the Kenwood name on it... Especially, if they come out with a new deluxe model with sub-band muting. As they are very likely to treat the current owners of V7-A's the same way they treated owners of TH-79A's (left out memory skip-on-scan capability)and when they introduced the capability offered NO upgrade to the current owners nor did they even give them a discount on buying the new "deluxe" model....

Source record: 186817

Hello, all

There was an article in the LA times about Teledesic and Bill Gates. Seems the LA times believes they will get all the spectrum they ask for......more spectrum than any one company has...except for the good old government. Seems 2m and 440 will either vastly shrink or cease to exist after WARC97, Remember, bill spends more money on his trash in one day than we spend on radios in the entire year.......

Seems the industry thinks that this Teledesic, with the "fund" they produced to fly FC commissioners around the world is just a form of bribery. Of course, they also have as a CEO an ex FCC commissioner...

Folks, don't go buying any new 2m or 440 gear. I think most of those bands as we know it will soon be gone. We may get more HF spectrum, though. Seems less and less people want these frequencies......

544. Question: FT-736R and bogus AQS messages?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-07 00:00:00 UTC
From: cruff@ncar.ucar.edu
Message-ID: <5atr0h$rpi@ncar.ucar.edu>
Source record: 186829

I just completed my serial CAT interface box for my FT-736R, and
am in the process of testing it. Everything appears to be working
fine, except every once in a while a bogus AQS message is output by
the rig.

I did some testing to make sure I wasn't getting random garbage from my
interface box. I get groups of 15 bytes within a 0.027 sec period
(which is close to what I would expect for 4800 baud and the limits of
the gettimeofday call I used to time it) with both valid and bogus AQS
message received numbers as the last byte. The contents of the messages
also looks like garbage.

It doesn't appear to be from the pager transmitter intermod (damn them!),
nor from other 1200 baud packet transmissions.

So, is there a way to get the 736 to not send these decoded messages?
I can ignore them otherwise, I guess.

GET REAL.

546. NEW ICOM IC-708????

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-07 00:00:00 UTC
From: Frank Krozel <frankeia@netcom.industry.net>
Message-ID: <32D295F0.6238@netcom.industry.net>
Source record: 186831

I got a call this morning from a friend and he stated there was a new
Icom at the last hamfest, (Indianapolis?). It appears that it is called
the IC-708. Last rumors on this unit stated it was DC to 450 Mhz, with
two filter slots...
Has anyone else seen or heard about this new radio?
Is the fan tolerable?
Does the two meter side still have the popping that both of mine
exhibited?
Frank KG9H
Does it have any new bands?

And it's all legit. It is called a "use" tax and is levied on out-of-state purchases so in-state merchants won't be at a disadvantage. Be advised that just about every state that levies a sales tax also has a use tax.

Well, yes & no ... On a carrier, they will use ALL kinds of Motorola gear
in addition to the military commo gear.

However the most ruggedized and durable hand held unit on the market today
is the 'Saber R' .. it's the submersible version mentioned above. But it
is available only in the Saber I, and Saber II versions. ie. a full
keypad submersible verision is not available.

556. FS: WW2 Hammarlund SP-600 (mdl JX-17), Hallicrafters S-108

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-08 00:00:00 UTC
From: "G. Frank Paynter" <paynter.5@osu.edu>
Message-ID: <32D48371.4A7C@osu.edu>
Source record: 186642

I unearthed the following equipment last weekend at my mother-in-law's house:

A WW2-vintage WW2 Hammarlund SP-600 (mdl JX-17). Appears to be in excellent condition (dusty from about 30yrs in a closet). Has original US Army Signal Corps stamp and nameplate.

Hallicrafters mdl S-108 SWL receiver.

I have no idea if either of these items have any value. I'd love to keep them for myself, but I've no room at my house - they'd just go from my MIL's closet to my basement <g>.

Anybody interested? Please contact me via email at:

paynter.5@osu.edu

TIA,

Frank

> If you know the jumper, would you please get back to me?
> Steve -

The jumper labeled "FX Alert" on the decoder board of the pager should
be jumped across with a small bit of solder. The jumper is the one
directly above the "X" of "FX".

Good luck with the modification, (be careful with soldering iron so that
you don't lift a trace up).

This actually appeals to me, I mean, then nobody can ask for a ride. :) This
is best accomplished with pickup trucks and two-seater sports cars.

>Seriously, I'm with the other poster who suggested that
>you go ahead and mount the radios wherever you can, and
>if problems occur, deal with them.

That could be an expensive mistake. First, are the radios that Jeff wants
to put in the truck remote mountable? If so just stick the RF decks at the
rear of the truck and mount the remote heads at the console. At the same
time be sure your power connections are nice and clean, no cheapy
plugging into the cigarette lighter types. I'd say that would work quite
nicely.

A friend bought an AT-11. The computer chip that controls the automatic matching function puts out a tremendous amount of hash. The company's response was to tell him how to switch off the automatic function and only tune when he needed it. Of course this completely eliminates one of the main reasons he bought the tuner in the first place!

583. WTB: Antenna tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-08 00:00:00 UTC
From: jbagge@xmission.com
Message-ID: <32d32465.897968@news.xmission.com>
Source record: 186685

Thanks for reading,
Name is Jim, I'm looking for an HF antenna tuner. I am on a very limited budget so I can't pay more than $100.00. If anyone has a tuner they are willing to let go in this price range please e-mail me at jbagge@xmission.com. or call at 801-964-6443.

Thanks,
Jim

Jeff,
I just bought a ft-50R from HRO and I got a few extra discounts too.
The original radio is 339.95 and they gave me a $5.00 promotional discount
and also a $20.00 manufacture's discount. I bought this at the burbank HRO
1-4-97, so I think that it is still valid. There number is (818) 842-5283.
I hope this helps.

I'm in the same situation. I picked up an Icom IC-230 at a hamfest and thought I could tune it to 145.53 and dedicate it to my PacketCluster station. Perhaps I was wrong.

If there is anyway to modify the rig to operate on that frequency (simplex, of course), I'd be real interested. How would I go about contacting WB6GTM via email?

587. which ant to use for 6mtr rptr?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-08 00:00:00 UTC
From: ka2qep@webspan.net
Message-ID: <5avf7s$rsd@news.webspan.net>
Source record: 186689

Hello, I am currently using a 6 mtr ringo at 60 feet for a rptr ant. The gain is 3.75db, the antenna is about 10'long. This is not a great antenna, but it put me on the air. Does anyone know which antenna would perform much better, especially for mobile work, say 50 miles or so? The antenna is on top of a ridge which is 1500 feet high, relatively flat. My friend bought a comet 6 mtr antenna which has always had a swr problem, so I did not want to fool with that. Any information would be appreciated.

Hello, I have a Icom 2KL 500 watt Amp and matching Icom AT-500 Automatic Tuner for sale. These units are in very good condition, both electrically and cosmetically. The 2KL amp has the 10meter Mod professionally installed. Works with all Icom radios, including the Icom 706! Coverage is 160m-10m and 500 watts output in RTTY, AM, SSB modes. Have original boxes, all manuals, worksheets, cables and hookup info. The unit runs off either 110 volts or 230 volts. Fully automatic, solid state, hands off units!
New cost on this equipment from Icom is now over $3500!
I am asking $1500, but am open to reasonable offers or trades.
Thanks.

Contact me via email at kg2ic@amsat.org or call 716/689-6727 evenings.

73,
Bruce KG2IC

In <2.2.32.19970104103214.006858b0@scscomm.com>, waheeb@scscomm.com writes:
>If this post has been sent to wrong place I am very sorry

For what? All of us have to start somewhere! You have arrived in the friendliest place in the world, ham radio. Sort of like Internet without wires! <Huge grin>

Once you discover what all this is about, you may embark on a lifetime of discovery. At 44 years into this thing, I am still having fun and, for the most part, the people in it are WAY above average folks.

>Could anyone explain to me what is packet radio, amateur radio and the
>difference between them.

Amateur radio is the permitted use of a relatively large part of the radio channels by individuals who do not have to pay for the right to use the channels. If you look at your broadcast radio, your FM radio and your TV set, you will see they are marked in channel numbers. Never mind about the meaning of that, right now, just discover here that there are MORE channel numbers above and below and between those that you see!

Many, many more. Whole sections of the channels are used by different people for different things! Police, fire people, constuction crews, people sending I love you messages from a cruise ship - they ALL use these other channels and MOST of the time they have to get a LICENSE from the government to use one or more of them.

Hams have to get licenses too. However, the hams use whole chunks of channels. Each chunk has different characteristics. Some chunks can be used to talk directly from Podunk, Texas, to Sydney, Australia, direct! On a good day, you can do that with the power of no more than a FLASHIGHT!

Imagine that, shining a flashlight up in the air and having it seen in Australia! Not only that but your little flashlight can be seen by THOUSANDS of people, all over the world at the SAME TIME! And, its all for free (well, not the cost of the flashlight or the very little for the paper work of the license), totally free, any time of day or night, just holler hello!

It is a priceless, fascinating hobby.... MAGIC that even David Copperfield cannot top.....

Now Packet Radio is a form of radio that packages up blocks of text and numbers into small groups within a larger message. It uses the radio channel to communicate these chunks of text to someone else, and while it is doing it, it makes sure that the chunk was received correctly at the

other end of the circuit. It is just one of MANY forms of amateur radio, but note... it isn't used just by hams. It is also used by fire departments, astronaughts in space... you name it.

>What sort of equipment do I need

A transmitter and receiver that operate upon a channel or set of channels that can be used with a similar type setup on the other end. Cost can be very little or LOTS. Like dogs, or most anything else, some dogs are bigger than other dogs. Ham radio is competitive and the my dog is bigger than your dog deal exists here too! That's part of the fun! It leads to CONTESTS!

There, a well trained little dog can often bite the heck out of even far bigger dogs... expererience and dedication count, just like other sports.

>Does it work worldwide or do I have to be within a distance of (say a tower >or station)

All of the above!

You may talk direct from you to someone else, or go through what we call a repeater station to help you.

Either way, your station uses an antenna. You buy or build your own antennas, some of which need be no larger than a foot or less in size, to HUGE ones that can require towers more than 200 feet high with wire lengths of 2400 to 4000 feet long.

The controlling factor for the tower and antenna size is the channel area. Some channels take bigger antennas than others.

Owning a St. Bernard can be a chore... Using the channels that require the huge antennas above takes space only found out in the country, but there are TONS of channels that can be carried around in your hand or pocket!

<smile>

All dogs are welcome!

>Anything extra would be very valuable

Yes indeed. Go to Radio Shack or a book store or a library and look us up! Your local library is a fine place, or in any event, one of several books you can thumb through is "Now You're Talking", published by one of the fraternal organizations in the hobby called the American Radio Relay League.

If you take it home, the chances are you will be started on this stuff!

In even most smaller cities or even out in the country, chances are someone will know of a "ham operator." Seek the person out, guys and gals abound in this thing!

The rest is all MAGIC!

>pls drop me email direct

Not really. I hope I've answered it in such a way that you will come back here or seek the area that will let you start this fascinating journey!

>Thanks in advance
>
>waheeb
>

De nada. !

I use the MH-39 mike and once you get used to it, its oK. But now I rely
mostly on the ADMS software for programming. The software is quite good
and easy to use and well worthit for this radio. I use it primarily as a
base radio, not moble. I am annoyed by the cross band auto-mute but not
much you can do about it. On the FT-51 I have the subchannel is
automatically muted when main active. On the Ft-8500, whatever channel is
set for mute is muted when other channel active.

> they are grouped together in sets.

Like most of these complicated radios, youll learn a subset of the
operation to get you going but probably not every thing. So having the
manual around is a smart thing to do. For instance the time comes to use
the radio in your car as a cross band repeater for the first. I have done
this recently. You better have the manual with you at that point.
Incidently, it works great in the cross band mode.

> 8 ohm external speaker in base operation, mostly.

I have not noticed any high pitched noise, perhaps I have a later model,
bought in Aug-Sept, 96. Having a couple of small stereo speakers outboard
is a real must as the internal speaker is not easy to copy from. The auto
mute is a poor substitute for the way they did it in the FT-51. I have
had no problems with memory failing in FT-8500.

I considered the FT8000 and thought for a little extra money the
additional features were worth it but at the moment, except for paging and
extra memory channels, I am not sure what additional features were.
Perhaps one was minimum 5 watts out ???. All in all, I am very happy with
my FT-8500 and considered that for my purposes, I made a good decision. I

also like the FT-51 which I bought first.

I understand the "use tax" part of the issue but I do wonder what authority the NY tax dept. has in obtaining records from an out of state company. If the comapny refused to provide sales records, what "hammer would the State of NY have? It's time for everyone to fight these kind of abuses by all levels of government. If local merchants are at a disadvantage due to higher tax rates in their home state, then they should initiate processes to lower the tax rate so they can remain competetive with adjacent states.

Waiting for the revolution.

A number of states have reciprocal agreements when it comes to sales tax.
That's likely the case here. However, if there is such an agreement, the
merchant (IMHO) has an obligation to either collect the tax or at least
inform the purchaser.

: It's time for everyone to fight these kind of abuses by all levels of

I'm not sure it's an abuse, but it doesn't seem like it is handled very
well by the states or the merchants. A proper disclosure would be in
order.

From: a71213@netrunner.net
Message-ID: <32d3e0a6.6556484@news.netrunner.net>
Source record: 186708

I am looking for a better antenna for the ft-50. Recently I read some articles here that discussed this, but I did not save them. What I am looking for is an antenna that has better transmit properties in the business band without giving up the ham bands. If I remember correctly someone mentioned the standard antenna. If any one has info on this please post or mail. Thanks.

607. Yaesu FT-8000R Mod Transmit CAP MARS

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-08 00:00:00 UTC
From: oliveriust@almeria.fontana.k12.ca.us
Message-ID: <852754150.12522@dejanews.com>
Source record: 186709

I have heard of two modifications to the FT-8000R that will supposedly allow extended xmit. One mod had something to do with removing a resistor on the control circuit board. The other said something about entering a freq. of 1234.560 on the right display, power off, then back on again.

I have tried the 1234.56 mod, and nothing changed. I am hesitant to try the resistor removal, since the parts are not designated on the board with their "R" numbers.

Question: What is the REAL Yaesu CAP/MARS mod for the FT-8000R?

>
>Any help or related information would be much appreciated. Thanks!
>

Oh dear, this really is a pity as you need the power supply that goes with the 551. This is in a separate box and provides all the required regulated power busses.

You need a 551 power supply. Power supplies for other 2-part Tek's (eg. 507, 517 or 555) will not fit.

If you find the power supply, the connection 1:1 so it is easy to make a cable yourself.

If you decide to build your own power supply, it will need to produce:

about 4 different 6.3 VAC lines at a total of about 10 A (My guess)

-150 V @ 100 mA
+100 V @ 100 mA
+225 V @ 200 mA
+350 V @ 350 mA
+500 V @ 50 mA

The current ratings are approximate but they do indicate that it is probably non-trivial to build your own power supply. Also, they need to be well regulated, typical ripple specs on these busses are of the order of 5 or 10 mV tt.

If you need more info, talk to Stan Griffiths (w7ni@teleport.com) who knows everything about old Tek scopes, Or EJ Holleman (e.j.holleman@student.utwente.nl) who has a 551 and is probably willing to give you a connector pinout if you need one.

Too bad about your scope, for it is truly one of the great classics when complete and working.

On the subject of classic scopes, you are welcome to have a look at the Museum of Tektronix scopes, which can be found at:

http://cal003109.student.utwente.nl/~wel/tek.htm

And should you get the connector pinout, it would be great if you would send me a
copy so I can include it in the museum on the technical info page.

Regards,

Arnoud.

Where did you get the idea that the P38 is a poor performer? QST certainly did not draw that conclusion. The P38 does better than everything else in it's price class by quite a margin -- and I would point out that neither the SCS unit nor Hal's own PCI-4000, while they may be slightly better performers than the P38, are in the same price class.

Source record: 186714

I have a TAPR/AMSAT DSP-93 kit for sale. Unit has been professionally built, checked out and works just super. Have orignal box, paperwork, manuals, cables, etc. Does all current HF and VHF/UHF digital modes. Modems are changed and updated via software so the unit never becomes "dated". TAPR's kit price on this unit is $430, I am asking $450 for mine assembled! Compare this unit the the AEA DSP2232 which retails over $1100. You may contact me via email at kg2ic@amsat.org or call 716/689-6727.

I have built one, and have run it for 100,000 mobile miles. I like it
very much. It has only one spur, on 7.208, but my box does not have the
cover fastened, as it was originally a temporary setup. Unfortunately,
temporary is longer than I originally thought. I cannot fault LDG on
this, as it is my fault that I didn't put the cover on it!
In the Chicago area there are several of these, and they all operate
very well. I would recommend the AT-11 as a very cost effective
approach to tuners that are force fed to be bought with the rigs.

> Please tell me if them will work.

Check the construction of the metal oxide resistors (ask the
manufacturer if all else fails). They are typicaly fabricated by
depositing a thin layer of metal oxide on a ceramic body, and then
cutting away some of the oxide in a spiral down the length of the
ceramic core.

This is obviously not what you want in a VHF dummy load.
It is possible that other fabrication techniques are used, but
you need to check.

The "non-inductive" resistors sound like the way tp go to me.

Philip

Hi,

I'm with an ingeneering firm working on a project in the Algerian desert. We want to use a couple of hand unit, some mobile ones and a central relay with an 80 feet antenna.

Two family of VHF products were proposed to us (one by a Canadian cie and one by a French cie). We have the choice between Yaesu VX500 and FTL2011 or Motorolla's HT1000 and GM1000.

Is there anyone that already work on a comparaison between the different products or that can indicate me a source of information? ('cause my 2 suppliers don't have any typ of comparaison).

Thanks.

>compare to ones costing much more? How does it compare to something like the

It doesn't offer as many adjustments, it can be easily overdriven to distortion
if the input level is too high, and it only handles one heterodyne frequency.
The steepness of the filter skirts is likely to be lower than that of a more
expensive DSP filter also. But for me, as a cheap heterodyne killer it is great.
For CW it isn't really a complete substitute for a narrow IF filter (try getting
close to a strong interfering signal that has been tuned out so it's not audible,
but notice the desired signal is weak because the receiver RF gain is down via
AGC).

>
>Does this mean that if you buy anything out of state you have to pay BOTH
>the out of state tax AND the in state tax?

Nope. Usually one or the other, but not both.

The idea is that your local in-state vendor should not be placed at a
competitive disadvantage just because he needs to collect your state's
sales tax while the out-of-state vendor doesn't. This primarily applies to
mail order sales. If you can show your state's tax collector that you paid
the out-of-state sales tax, you shouldn't have to pay your state's use tax.

YMMV.

Disclaimer: I am =not= an attorney and you should seek competent legal
advice before making any decision regarding taxes; sales or otherwise.

out-of-state
> purchases so in-state merchants won't be at a disadvantage. Be advised
> that just about every state that levies a sales tax also has a use tax.

Does this mean that if you buy anything out of state you have to pay BOTH
the out of state tax AND the in state tax?

What if you travel out of state, buy something, dispose of it, then return
to
your own state? Are you still double-taxed?

If this all is really true, then wouldn't it be interesting to watch state
officials
when they travel out of state and make a log of their purchases, then
report
this info to the state tax dept? Isn't it great when everybody is a
criminal?
You know, most tax depts offer rewards for whistle-blowing...

Had same problem with PR-20. Try a quick fix by turning up current
limiter. The supply is very sensitive to surges so this alone may
work. If not put small filter caps from positive and negative to
ground. If you do this you should put a polorized A-C PLUG on. Finnaly
if this doesn't work try a choke input on the supply. Good luck this
is not a very good supply.

What makes this 'not a very good supply?'

I've been using a PR-25 for some time, and never had a problem. It
sounds to me like both you and the original poster have RF floating
around the shack, and getting into the power lines.

I have HF, VHF and UHF transmitters with both coax and balanced
feedlines to the antennas, and have no problems with the power supply.
I also make sure all my equipment is grounded to a single point ground
with the house wiring.

MY PROBLEM is RF getting out of my computer case and into my
receiver.<grin>

>Gary K9GS

Gary,

When you replace the caps get rid of the crummy carbon resistors across them and use 50 to 100 k metal film or wire wound types with the proper dissipation

It is usually the "bleeder" resistors in the Dentron that cause the caps to fail. Carbons should NEVER be used in a resistance critical application.

Hi,

Try giving Pembleton Electronics in Fort Wayne area code 219
a call. He had/has tons of old Textronics stuff around. He's
right across the street from the old Magnavox factory and
surpluses a lot of their stuff, and others as well. Not too
big in computers, but about 30,000 sq ft. Closest thing to the
Chicago - Michigan Ave joints of old. Any grins out there?

I own both the 733 and the TM-V7A.

GO FOR THE TM-V7A if you can afford it!

The TM-733 can be purchased for about $400 right now.
The 733 is being discontinued.

I think the TM-V7A is a way better radio on every level. The
display is the best I have seen.

The controls and programing are great. Its very useable from the drivers
seat. The menus are friendly. I have had no problems or glitches with it.

The only nitpicking I can do on the radio is 1) No mute and no wireless
memory transfer.

Other than that NO COMPLAINTS.

I also have on and like it very much, however its receiver is not as good
as my TS-450 or Yaesu 900. I also would not suggest that you buy the
narrow ssb fileter as it is not narrow enough. All in all it is a GREAT
rig for the money! Add 2Meter adn 6Meter SSB and you can't beat it!

>some pins of this connector. And, if so, which pins it would be?

>Any help or related information would be much appreciated. Thanks!

>Robert Bernstein
>rdb@silcom.com

I just happened to have an old 1967 catalog at my desk and was amused to see a picture of your old 551 sitting next to its enormous power supply. The supply was two thirds the size of the scope and weighed in at 43.5 lbs. I know nothing about these old scopes other than the fact that they were the best there was at the time.

658. MFJ-259 Mod - MORE POWER!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-09 00:00:00 UTC
From: grhosler1@mmm.com
Message-ID: <5b35pg$sod@dawn.mmm.com>

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have been using an MFJ-259 for the past couple of years and love it. One area where it falls short is output power. I found this when I tried to set up a Mosley CL-33 beam (capacitive coupling feed). The analyzer had me going in circles till I finally just put some RF to the antenna and found that it was fine. The MFJ-259 simply did not have enough output to couple properly to the CL-33. Last night I built some antenna traps and used the MFJ-259 to resonate them. I later placed the traps in PVC to protect them from the weather. I tryed to dip them with the 259 to verify that the resonant frequency had not changed, but the analyzer didn't have enough poop to adequately couple to the trap inside the PVC. I dug out an old Knight brand Grid Dip Meter and it worked (with the usual GDO characteristics). I'm sure that I'm not the only one who has experienced this problem with the MFJ-259. Has anyone out there modified their 259 to increase the output? Lets face it, it needs MORE POWER,.....ARR, ARR, ARR! Thanks for taking the time to read this.

A ham friend of mine is looking for a used 2 Meter all-mode rig with built-in PL tones and memories for under $300 from anyone who lives in the Los Angeles basin area only.

He's also willing to trade a 600W (PEP) mobile HF amp he has or he will sell the amp for $375

If interested, email me with your phone number and I'll forward your message to him.

Happy New Year, all.

I'd like to be able to record (unattended) my favorite radio programs and features for later listening. Something like a VCR with multi-event programming would do the job nicely. Some have suggested using a VCR and a tuner connected to the audio input, but that would require going back and retuning the receiver to different stations between events, which is not possible in this case.

Any ideas? Thank you in advance.
Michael

I am looking for information on the Uniden/Bearcat MR8100 Scanner.

Looking for any software for the RS-232C port.

Does anyone know the software commands so I could write my own
software program.

Looking for any mods.

Looks like a well built receiver but would like to hear from
MR8100 owners.

664. TS-130S fan, mods and other questions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-09 00:00:00 UTC
From: aswNS@hamp.hampshire.edu
Message-ID: <32d531b0.0@news.hampshire.edu>
Source record: 186560

Thanks to the several people who e-mailed me in response to my query about the TS-130S I bought sight unseen that arrived without a cooling fan. My news feed is screwy this week, I don't know if they also posted here. In summary (very briefly) the fan does not seem to be necesary in normal operation, at least for cw or ssb. The July 1981 QST review says the review unit they obtained gave them doubts about whether the fan circutry was working, since it didn't run at all in a couple of months of normal operation. In the ARRL lab the fan did work when the rig was run keydown continuously into a dummy load.

I have some more esoteric questions now, about possible modifications and other things:

1. On my unit someone has made a mod that involves putting a switch in series with one of the lines from the rearmost connector on the PLL board. I am not sure of the numbering coventions, it is either pin 3 or 4 of J15, which would be line C1 or D1. Both of these lines go to the counter board. The question is, why did someone go to the trouble of installing a switch to open this line? The visible effect is that the display is blank on the 18, 28, and 28.5 Mhz ranges when the switch is open.

2. On the RF board there are 5 black jumper wires labelled J1 through J4, and J6, that connect the front of the board to the rear. They are soldered in at both ends. There is also a brown jumper labelled J5 where it connects to the board at the front, but the other end is a push-on connector, meant to connect to single pin-type connector on a board. The problem is, this wire is just hanging loose, near the rear of the vfo enclosure, and I have been unable to find where it is supposed to connect on any board within its reach. I presume it is meant to connect to another board, or perhaps it is just used for some testing? None of the jumpers J1..J6 are identified on the schematic.

3. The meter doesn't seem to indicate anything in ALC mode. Can anyone suggest a reason why this might be so? Is it possible there is a jumper that might have been removed to enable ALC voltage to be fed back from a linear amplifier? I don't think my mysterious unconnected brown jumper is in the right part of the circuit to be involved in the ALC.

4. I cannot find a serial number on this rig, which I bought by mail from someone I don't know, but who apparently is in the business of buying and selling in the Virginia, USA, area, and whom I have been told by third parties is well-known and reputable. I have only a photocopy of the manual; the fuzzy picture of the rear of the set makes it look there may have been a nameplate of some sort on the

fan mounting plate which I am missing. Can someone verify this? Also, there is a hand-engraved ID that looks like a Minnesota drivers license number on the heat sink. I feel some responsibilty to verify that I haven't purchased a hot item. Can anyone tell me how to go about checking this?

Am I asking these questions in the right place? I know there is also a Vintage Solid State mailing list, would that be a better place for these questions?

> Chapel Hill,NC

Hmmmm.... what do you mean, it does not have QSK? Is the recovery slow?
How slow? Mine will barely recover between code elements at about 15-20
wpm, and will of course easily recover between words.

Which AGC mod are you talking about? I have one that inserts an RF gain
control, and this didn't affect QSK.

It is of couse possible that it was specifically modified for slower
recovery. If so, it is likely that this was done at the main TR DC
switching circuit. You probably have to look for a bigger capacitor than
the schematic plugged in somewhere.

Good luck, and E-mail me privately if you don't have the manual or schematic.

Wanted:

I am looking for models KMC-95 and KMC-96 made by King,(a division of Allied Radio/Bendix-King), which used to be sold at swap meets a few years ago as retired-surplus HF marine radio equipment.

They're easy to spot if you happen to have any stacked in a pile of old radios, because both had white plastic covers and the KMC-95 transceiver front and rear panels are black. The KMC-96 tuner has no front control panel but the rear panel where the cables connect may be black.

Please email me if you have any that work or that are good for parts.

Thanks.

Me, too!

I bought a Reveal FM radio board for the PC (about $40 at Best Buy), with the idea of being able to program it as you suggest.

<flame> I got disgusted at the dain-bramaged software that came with it (only 10 presets, hard to set with fixed scroll rate, roundoff errors in freq display, . . .). I'd have kept it if I could have gotten specs for how to control it -- I'd have written a control program myself. But their "24/7" tech support line put me on permahold so I gave up and returned it. </flame> I could always buy another one if I decide to try it again someday. It seemed like a well-build piece of hardware.

Seems like you could build an integrated control out of an old XT with the FM radio card in it and an IR emitter to drive the VCR. If the VCR won't record sound without a video signal to sync to, put a CGA card in the PC; you could put a timestamp on the video to tell you when the audio was sent, freq, station/program ID, etc., in nice bold characters that would show up in fast forward / rewind.

If your existing FM receiver is IR controllable, then that opens other possibilities.

I agree, this is a product that is missing from the marketplace. Probably wouldn't be terribly hard for the VCR makers to implement, either; they already have the front end, what's a couple more chips for the FM broadcast IF and detector? They can sell an entire Walkman for $cheap. . . It'd be neat: an 8-hour stereo audio recorder! There's not much on the tube worth watching, anyway.

We can't be the only two who've felt this need. Ideas, anyone?

-rrk

The MR-8100 was an OK scanner, but somewhat sensitive to intermod. Despite that, I use one exclusively while mobile. The capability to upload frequencies is really useful, as I travel a lot.

For software, I would refer you to my Web page:

http://ourworld.compuserve.com/homepages/Scan_PikesPeak

Regards, Ken Wyatt WA6TTY

Here's a review I wrote on the MR-8100 some time ago:

MR8100 Scanner Review

by Ken Wyatt, WA6TTY

(Revised 9/5/96)

Overall: This is a well-built and laid out scanner which was designed with input from the California Highway Patrol. The enclosure is made with cast aluminum and there are numerous internal shields to isolate the various sections of the receiver. It covers all the usual public service (plus 800 MHz), aircraft, and government bands. The only exception is the military aircraft band (240-400 MHz). The radio is about the same physical size as other mobile scanners, but all the controls are mounted on what would be the normal "top" surface, leaving plenty of room for oversized controls, along with a large alphanumeric display. The radio includes 100 channels arranged in banks of 10 and the scan rate may be toggled between either 35 or 100 ch/s. The audio is clean, with three watts of power; adequate for the inside of a dump truck! The

radio must be mounted against a flat panel or on top of a floor-mounted system and will not work for the typical under-dash configuration. The radio does not have a built-in speaker, but comes with a remotely-mounted one. Scanner World also supplies IBM-PC programming software (on 3 and 5.25 disks), along with an interface cable. {See note below}

Controls: The radio includes all the usual controls. Missing is a scan search/store feature and the capability to -not- delay a channel. The user may program frequencies, lock out channels, and manually step through programmed channels from the front panel controls.

Display: The display is a large (about) 20 character alphanumeric type with variable backlighting and contrast. It displays the channel number, and either the frequency (to four significant digits) or a user-programmed alpha name (upper/lower case). Unfortunately, while the display indicates frequency out to four decimal places, the firmware only accepts three decimal places for PLL programming. Thus while you -think- the radio is tuned correctly to one of the "splinter" channels, it's not.

Computer I/O: Yes, this radio may be programmed via an RS-232 port! Software is included to program frequencies, name channels and banks, and set prioity channels (one per band). Scanner World supplied the wrong cable, but those who use the (typical) DB-9 connector (COM1), may simply purchase a "straight-through" 9-pin to 9-pin cable. The frequency (scan) list may then be stored and retrieved from disk. The cellular channels are unavailable via the front panel, but the software allows programming these if you enter the correct password, "ECPA1986"; would you believe! Connection of the scanner must be made to the COM1 port of your computer (not mentioned in the manual).

New MS Windows-based programming software is currently under development and preliminary copies may be obtained via AOL or CompuServe in their ham radio areas. The filename is "PSCAN.EXE". It's really slick!

Performance: The radio performs fairly well, overall. The sensitivity is on par with similar mobile scanners. The receiver IS susceptible to strong signals, such as paging transmitters. This results in an intermod problem where either paging tones will come through or signals will be received that you aren't tuned to. For me, this only occurs within large metropolitan areas, and only in places of high level rf energy. For example, within Colorado Springs, I have run into maybe five or six "bad" localities. At least 95% of the city is OK. As a first trial at solving this, I placed a variable step attenuator in line with the antenna. Usually clicking in 10-30 dB will do the trick, and doesn't impact reception of stations that much.

I have also tried Grove's Scanner Filter and while I'm sure it
would help if the receiver was overloaded by broadcast stations,
it does little for the variety of paging transmitters in this
area. The step attenuator seems to work the best and is what
I'll use for my permanent installation. I wish the radio had a
built-in attenuator like the PRO-200x series.

Summary: The scan rate of 100 ch/s is wonderful. I am usually
able to catch the first syllable of a transmission, unless there
is multiple traffic occuring. I don't know why one would wish
to scan at it's lower rate. The audio is clean with plenty of punch.
I find that permanently leaving 20 dB of attenuation between the
antenna and radio gets rid of the bulk of intermod problems, while
still allowing good reception. I like the fast scan rate and
having banks of 10 channels is really convenient if one travels
through different areas, or wishes to lock out complete services, etc.
I travel a lot, and find it very conveneient to be able to upload
a new set of frequencies/channel names every time I enter a new state.
I use my HP 100LS palmtop computer for this task; keeping a host of
frequency files loaded in memory.

Pluses: Good clean audio
100 channels in 10 banks
Fast 100 ch/s scan rate
Alphanumeric channel information
Large readable display
Programmable by computer
Ruggedly built

Minuses: Low-to-moderate problem with intermod
Only choice is a 2 second scan delay
Awkward mounting; no under-dash install. possible
No search and store capability
No military aircraft band

Available only from Scanner World, $289, plus $10 shipping.

NOTE: As of three years ago, Scanner World ran out of these.
Occassionally, they may be found used on rec.radio.forsale.

So is there any hard information about this new radio? Will it cover
70 cm all modes for instance?

Ok on the Yaesu, I heard a rumour that Kenwood would be bringing out
something similar to the IC 706, any news on that?

Gav,
GM0WDD

The construction is quite bad. The box twists around when you turn the
roller inductor. I placed two big bricks on top of it. If you turn
the inductur too far..... it's gone ! There is a very poor stop on the
inductor, it's only a small peace of rubber fixed with glue.
If you are really running 3 KW's.... forget this tuner. I heard it
whistle with 100 W !
If you are looking for a better product: The Tucker T-3000 is about
the same but the construction is much better (same as Vectronics).
My advise: Save your money and buy a better product !

Nope! There are none for sale in the US as of 1/8/97 but it is
"_supposed_" to be any day. I think it's the 6 meter portion that is the
hold up on FCC approval since a "normal" HF rig would have been approved
much faster. Keep an eye on http://www.icomamerica.com since I'm sure they
will announce the approval as soon as they receive it.

I don't think the tm-733 from kenwood has it either as a local
commercial pager transmitter about 1 mile away on 153MHz wipes out
the entire 2m band when it transmits! 700uk pounds for junk!

I have a problem with my Viking Valiant II transmitter and need a bit
of help in tracking it down. There is no grid drive only on 80 metres
except when the OSCILLATOR switch is in the ZERO position. The problem
only occurs on VFO. It works fine when using crystals and using the
VFO on all the other bands is OK.
Thanks....Mike VE3FGU

Message-ID: <5b3e9o$27n@fcnews.fc.hp.com>
Source record: 186580

On the FT-8500 microphone:

I have the joystick model (FS-10). I believe access to volume, squelch, band switching and most other things are quicker, but you probably pay a price with the higher learning curve. I've heard people complain about the size and it being easy to mess up something inadvertently with the mike, but these don't seem to be problems for me. I'd give it a 7 out of 10 for usability. I believe the joystick is somewhat of a gimmick and the function could have been implemented more effectively in other ways. Bottom line, it's a bit intimidating at first but is generally very effective at one hand control of radio functions without having to look at the mike or radio. If you enjoy gadgetry, this is the one for you.

Got an idea for Yaesu. It's a pain to switch in and out of DTMF autodial mode on the 8500, but it's something I seem to need to do often. When the radio is in non-autodial mode, have a press of the ENT key cause a subsequent number button press to select that autodial memory instead of the single DTMF number...

From the top of the radio it is located on the top/ rear of the
radio. It is in the section nearest the fins. You need to remove the
shielded cover to the pa (power amplifier). The adjustment potentiometer
is usually blue. It is a plastic pot. It is located near the p.a. input
which comes from the exciter. The exciter cable is a small gray wire on
the left side (if the front is closest to you) of the radio.

My ICOM 751 is pretty well shielded - I mean the computer hash HAS to
come in on the antenna line to be a problem. Since I use well shielded
coax for the run to the antenna a hundred feet away, I have no
computer hash I can hear. Back when I had an antenna tuner in the
shack the hash could get inside it and then into the receiver.

I need a 2M exciter to drive an amplifier in an industrial application. I would like 50 watts out
CW (really CW, 24 hrs/day!), but can use a unit with 10-15 watts out to drive a brick amp. I'm
not very familiar with what's available, but I'll bet someone has a 2m XMTR or XCVR they want to sell
which would do just fine as a CW source in my application. Thanks.

What do you wish to do specifically with the 1278?? I use pcplus,
simpterm and any number of other terminal programs to run mine. There is
also a program that mfj has for use with windows and the 1278. Somewhat
costly considering that all of the others seem to work just as well
without all of the bells and whistles. I have also run it in kiss mode
using jnos in an old XT and a newer 286 AT, so it is a very versitile
black box to hook to a radio and a computer.

I may not always agree with what you say. But I will defend to the
death your right to say it.

Isn't this interesting from the DRUDGE REPORT

GINGRICH'S CELL PHONE NIGHTMARE

Political scandal has come crashing into the digital age. The NEW YORK TIMES kept everyone in Washington, DC up late on Thursday by publishing extended excerpts of an audio tape that captured Newt Gingrich in a conference call with others on the morning of his ethical mea culpa.

The call was picked up on a police scanner in Florida.

The conference call was over how to counter the inevitable Democratic attacks and how to time the admission with newspaper and evening news cycles. The call caught on tape provides top insights into the methods and intensity of spin used to calm and convince the public mass. It is proving to be a complete embarrassment for the Republican leadership.

"Oh my lord -- why is anyone talking on a cell phone," a Republican source on the Hill told the DRUDGE REPORT after getting briefed on the TIMES bullet.

The phone transmission originated from one of the participants in the strategy talk, who was no doubt taking a Christmas break in the sunshine state. Newt was at is home in Georgia; others taking part were in Washington. The TIMES says the tape was given to them by a Democratic congressman who was slipped the goods by a couple in Florida who overheard the call on their scanner. Calling James Bond.

(It should be noted that it is a federal crime to make audio recordings of any and all activities that occur on such scanners.)

Gingrich being caught on tape is a twisted irony. Leading Republicans on Capitol Hill have recently issued warnings to all staffers about the dangers of talking on cell phones in the current partisan-charged Washington, DC atmosphere. The National Enquirer's public announcement that they were soon going to open a Washington bureau also added to the growing cell phone fears.<

> Thanks....Mike VE3FGU

Unless someone knows the internals of that rig, everyone will be making wild guesses. If the vfo is bandswitched, then you probably have a bad contact on the 80 switch contact. I can only assume that the ZERO position removes power from the amplifier stages, which leaves the switch contact idea in the cold.

Trying to analyize your problem with so little information is like trying to give a haircut by mail!

707. Two 386 laptops for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-09 00:00:00 UTC
From: Mike.Ward@f150.n2613.z1.fidonet.org
Message-ID: <852852668.AA07489@rochgte.fidonet.org>
Source record: 186603

```
* Original To : Sale@ALLUSA, 1:2613/150
* Original From: WD4SGU, 1:2613/150
* Original Date: Jan 07 13:34

For Sale: two 386-based portable computers.

1) GRiD 1450sx 386sx/20 with 5mb ram, 40mb hard drive, 2 serial
ports, 1 parallel port, internal 2400 baud modem, backlit
VGA display, external VGA port, 1.44mb 3.5" floppy drive,
large-key keyboard, external keyboard port, 2 ac adaptors,
shoulder strap for carrying, original box and manuals. It can be
operated directly from the AC adaptor or an external 12v source.
I also have 2 rechargeable battery packs for this one, but neither
of them are charging. They contain AA nicad cells, so they could be
rebuilt if you wish using surplus batteries. The ac adaptor can
be plugged directly into the battery for charging. $250 OBO.

2) Tandy 3820 386sx/20 with 4mb ram, 60mb hard drive, 1 serial
port, 1 parallel port, internal 2400 baud modem, backlit VGA
display, external VGA port, 1.44mb 3.5" floppy drive, external
keyboard port, ac adaptor. Battery pack is near death, but
replacements are available through Radio Shack and other sources.
It can be operated directly from the AC adaptor or an external
12v source. $300 OBO.

Please reply here or send email to me at wd4sgu@juno.com

Thanks
Mike - Rochester, NY

708. FS: 9600 Packet TNC

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-09 00:00:00 UTC
From: jcscrutc@wolf.co.net
Message-ID: <32D52567.6077@wolf.co.net>
Source record: 186604

Hello
As I'm cutting back on the number of ports on my bbs here, I have some extra TNC's for sale.
I have a PacComm Tiny-2 with the PacComm EM-NB96 External Modem connected to it. The pair will work either 1200 or 9600 narrowband packet. Both units look almost like new and work fine, just took them off the bbs. Also have the manuals for both units.
The price is $140 for the pair and I'll pay UPS shipping.

I also have an MFJ 1270B that looks and works fine and has the mailbox and fax eprom in it. Asking $60 for this one and includes the book.

You can email me at jcscrutc@wolf.co.net or call 507-377-3801

Phil:

If you need to make a real brute force dummy load, check out surplus outlets for Carborundum Corp silicon carbide resistors. These resistors are often used as industrial heaters or in kilns. They often take the form of a rod or tube, typically 1/2" to 2" diameter and 6" to 24" long. All sorts of resistances. The terminations are a silver fired onto the ceramic body at each end. These babies are tough! And absolutely low inductance. I have used them as sense resistors in lightning pulse generators and as super RF loads. Immerse them in cooling oil, and dissipate away!
The big problem for you is impedance matching. It takes some imagination to configure one of these into a termination that properly matches the RF source. After all, the whole purpose of the dummy load is to transfer and absorb all of the RF, not reflect it. So, you not only have to consider the dissapative element, but the housing around it. Remember that the physical dissapator will act like an antenna if it's left out in the open "electrically". In the VHF range, you can't just hang a resistor on the end of the coax, it should be contained within an extension of the coax shield (otherwise the dummy won't be totally dumb) which doesn't create impedance discontinuities.

710. Need Racal RA-6790 Help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-09 00:00:00 UTC
From: skytron@ix.netcom.com
Message-ID: <32d4fb4d.10468668@nntp.ix.netcom.com>
Source record: 186606

Help!
I have a Racal RA-6790GM Receiver that I received as is. The front panel shows all zeros and the keypad is dead. I have investigated the A9 display board and the A6A2 controller board. On the A6A2 board I replaced the battery and fixed the traces damaged by battery corrosion. I have checked the board as best I can without the schmatice using an O-scope and meter. I am qualified to repair this radio but what I need the the schematics and or board service instructions. The manual I received with the radio did not include the schmatic diagrams.
If anyone has the schmatics for the A9 and A6A2 controller board and has a scanner, I would be very greatful if they could scan just those pages and either post them or send them via E-Mail.
Once I have the schemaitics, I think I can repair the radio. Any other troubleshooting assistance would be appreciated.

Also if anyone has a A6A1 RS-232 interface for sale or knows where to get one please let me know.

Thanks in advance for any help.

Hello,
I am selling a VHF Motorola HT-1000 for a friends with the following:

16 Channels
2 Batteries
Public Safety Microphone
Antenna
Rapid Charger

The range of the looks to be in the 150-174 range.. but not for sure.

I don't know what is currently programmed inside the radio except it was a
fellow police officers old duty radio.

4 Watts and in GREAT condition... Asking $450 + Shipping

If interested please let me know... N9MXT - Jeffrey

Randall J. Zaleschuk wrote:
>
Will,

The SMA-501 IS NOT the same as the miracle baby for the BNC radios.
They advertise it to be, but it is not. I did extensive testing of
both.

This seems to be the rating I came up with:
These are all 8" and shorter antennas. Range was tested on 10
different
repeaters TX/RX with multiple locations in a general area to get rid
of
space diversity differences.

Best listed first:

Dual Band 727 Yaesu Antenna BNC
Dual Band Larsen BNC
Yaesu Stock Duck on FT50 BNC
Miracle Baby - BNC
Standard C508 Duck SMA

SMA-501 SMA (I've seen dummy loads better than this one)

The SMA-501 that I bought is terrible. It is not even close to my
miracle baby with a BNC-SMA adapter!!

The local vendor may in fact lose your sale, but in the case of big ticket items like radios, cameras and computers, the vendor is probably involved in mail order sales and picks up out of state customers of his own. I think New York has a FEW mail order camera and computer places and I'm sure they welcome out of state sales from people trying to avoid high local taxes in their own states. In other words, it's a wash; it is not the vendors who are complaining, it's the tax collectors and we should tell them to take a hike (not a tax hike).

Albert S Woodhull (aswNS@hamp.hampshire.edu) wrote:
: I had a Kenwood TS-130V and used it in a casual way for a number of
: years. This is the low-power version of the TS-130S. I liked it, but
: I decided I want a full power rig for times when I really want to be
: able to keep a schedule. Someone who wanted the 130V pointed me to
: someone who had a TS-130S for sale, and with his help a 3-cornered
: deal was worked out. My TS-130S just arrived today, I haven't even
: turned it on yet.

: There is a problem with my new rig -- the cooling fan has been
: removed. I know it is thermostatically controlled, and the control
: includes transmitter shutdown if heat becomes excessive, but I am
: quite sure from the documentation and looking for ads from the early
: 80's when these rigs were new that the cooling fan wasn't an option,
: it was standard on the TS-130S. It is also quite obvious from looking
: at the unit that it once did have a fan; the tapped holes where the
: fan was mounted are somewhat roughed up.

: I am a little concerned about the danger of damage and the possibility
: that I won't get top performance out of this rig without the fan. From
: the old ads I have learned that a few years later Kenwood released the
: TS-130SE with an optional fan. It appears the control circuitry of the
: SE is more sophisticated and power is proportionally controlled if the
: temperature rises too much. But with no former experience with these
: rigs, indeed, never having seen a TS-130SE, I have no idea whether the
: optional fan went with a larger heat sink, or whether there are other
: design features of the SE that make it less sensitive to overheating.

: I would appreciate hearing from anyone with experience with these rigs
: who can tell me how much I should be concerned about the absence of
: a fan on the TS-130S. I think it will be easy to rig up a light or
: some other indicator to the fan power jack to let me know when it is
: trying to turn the fan on, and I imagine I can learn to run at a
: reduced power level that is safe. I can probably also mount some kind of
: surplus fan behind the rig. However, from pictures in the manual it
: looks like the fan was mounted on a plate that covered the back of the
: heat sink, and I presume this had some function in controlling the air
: flow. If anyone can help me locate an original-equipment fan with
: mounting plate for a TS-130S I would appreciate that, too.

: n1aw@k1mea.#wma.ma.usa.na

Al,

Thought you might like to see the following recent post.

I own a TS-130SE and the fan mounts with screws, but plugs-in
electrically (not hard-wired).

The July 1981 QST review of the TS-130S said:

"Because the finals are solid-state, Kenwood has taken precautions
to protect them from conditions that might lead to their
destruction. A large and quite effective heat sink is attached
to the finals. In fact, the heat sink on the finals is lager
than the heat sink on the compainion PS-30 power supply. A
very quiet fan is mounted on the heat sink of the '130.
Normally, the fan is off; when the temperature of the heat sink
rises above a predetermined level, the fan is switched on
automatically. For the first couple of months that I used the
rig, the fan did not come on. I had begun to suspect that it
might be defective. During the lab tests we locked the
transmitter on at full output power (into a dummy load of course).
The heat sink warmed up rapidly, and the fan did come on. It
is an extremely quiet, but effective fan."

Hope this helps.

> HELP!!!
> WB5APD
> Bob

The normal offset for 70cm repeaters is + 5mhz, so the default is
correct. The problem you're having might be the lack of a PL encoder.
Most 440mhz repeater use a subaudible tone for access, which your FT709
may be lacking, or it may not be programmed properly.

Good luck,
Scott

I am doing research for a very large international interest, who is interested in purchasing mobile/portable field operated HF radios, possible with a couple of channels. Can you provide me with any information regarding this request. Thanks, your urgent attention would be appreciated.

Thanks!

From: Dave Burr <dtburr@mcs.com>
Message-ID: <32D6C0BF.19C6@mcs.com>
Source record: 186436

Gang:

I recently made a change to a new rig, and after considering the IC-775, the TS-950SDX, and the FT-1000D, the FT-1000D was the clear winner. (I'm into DXing and contesting).

The one I bought was owned by a guy who bought it and dropped dead or something so it is in mint condx w/low hours, but is about 2+ years old. Anyone know what upgrades or mods have been available through the years? They have been making this rig for over five years now.

Any FT-1000 owners out there in the know?

Thanks

Dave

Good luck however, you need to do two things.
1. debug your database since regardless of what choice of gear chosen, the xcvr selection ALWAYS is returned!
2. There must be more specific categories such as "HF amplifiers, VHF amplifiers" etc..
Hope these suggestions help.

Source record: 186438

How does the digital battery voltage work on the FT-50R?

Also I see what looks like a speck of plastic between the lens and the LCD on the upper left corner of the display, I can't tell if it's supposed to be there or not. Probably just a piece trapped in there I guess.

Too bad about your scope, for it is truly one of the great
classics

"Great"? "Classic"? Hardly!! There are a few early Tek scopes
(pre-465) which could be described with one or both of those
adjectives, but the 551 sure isn't one of them! 511, 545A, 547
maybe, but 551? Abomination would be a better descriptive term
to use. Most people who have worked on 551's would agree that
the 551 serves only to remind us how primitive the technology was
in those days. The fact that something is old does not
necessarily make it either great or classic. Don't let nostalgia
cloud your common sense.

> e-mail : thomasm@digianswer.com

I have used a Kenwood TM-733 for a year and a half, and I think it is an excellent radio. A message posted on news:rec.radio.amateur.equipment a few days ago indicatd that the V7A does not have sub-band muting, which I think is a very important feature. I would definitely recommend the 733.

As for the intermod "problem", I live in a low-population area, but I have taken the 733 with me through Chicago and St. Louis and found that the "advanced intercept point" feature does a good job of cutting down the intermod.

Mods for the 733 are available at

ftp://oak.oakland.edu/pub/hamradio/mods/kenwood

As a side note, if anyone finds the mods for the V7A, PLEASE e-mail me!

Your operating mode is an important consideration. I have a 733 and 732.
I prefer the 732 to the 733 only because of the display. I like over
and under better than left/right, because when mobile I can read the
display faster. The 733 & 732 have too many features for easy mobile
use. It is easy to forget keystrokes for unusual features unless using
the rig very often. I really like both of my KW rigs and prefer them to
my local EMA Icom late model dual banders. For the VM-7, I would be very
cautious of a brand new model. Looking at the KW web site, the newer
rigs have many service bulletins, unless it is a upgrade model. (The 732
had about 10 SBs, but the 733 only a couple because it was an upgrade 732
design) I beleive the 7 is a new design, and it is missing one VERY
important feature. The MUTE function is priceless in mobile or base
operation. I use my rig most often on the road or in emergency
communications, and the MUTE feature will keep you from missing that key
item of someone else's QSO. Plus the 733 is about $200 bucks less than
the 7. The 733 out of the box now has the backlit mic (very handy) and a
duplexer (also handy). Also the 733 has extended RX without the extended
TX out of the box (my 732 requires a mod for public service freq RX, and
this mod also allows TX in pub sev freqs - not cool). It's your money,
but my 732 has been with me for 4.5 years, and my 733 since October. I
really like the 733 & 732, that I would keep the extra bucks in my pocket
and pickup a radio that has had its design problems worked-out before it
was shipped to your local dealer who is now closing them out. The 7 is a
good radio, and in a year, the bugs will be worked out and a great radio.
But by then the 733s will be gone......
Good Luck and good hamming
KC4YOB
Paul

You are very INCORRECT! LEO Satellites want spectrum in the 130-170
and 440 to 455 MHz range for data-only services. The cost of end-user
equipment is far less than in the GHz range. And the Little LEO's are
not the only entities that want ham bands.

It is purely a matter of economics. 2 meters and 70cm are woth tens of
billions of dollars in corporate profits to any industry that can grab
the bands from hams. We are at war for our survival!

I'm looking for a service manual for a Kenwood TS-430S. If you have
one that you would like to sell please email me. Thanks and 73,
Alan KE3OK@netins.net

759. Kenwood TM-V7A Visual scan and Spectrum scan

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-10 00:00:00 UTC
From: tnic <tnic@styx.ios.com>
Message-ID: <5b6e55$g5@nnrp2.farm.idt.net>
Source record: 186503

Yaesu Kenwood and other radio manufacters are jumping on the Spectrum scan (tm)/Visual Scan (tm) band wagon.

This seems like a solution to a problem no one has.

I guess there is some value knowing somone is transmitting somwere else on the band but I always took that for granted.

Is anyone else using this feature in a way a simplistic radio operator how I can appreciate this feature better.

I like the TM-V7A and have a review if you are wondering about it - email me and I will send it.

tnic@ios.com

>You are very INCORRECT! LEO Satellites want spectrum in the 130-170
>and 440 to 455 MHz range for data-only services. The cost of end-user
>equipment is far less than in the GHz range. And the Little LEO's are
>not the only entities that want ham bands.

Right. It's the frequency wholesalers who want 'em. There's a chance
they might make a buck or two on resale, so it's worth the gamble. But
it's difficult to see how someone with that as their sole demonstrable
need for the spectrum, could make a persuasive enough argument to the FCC
to displace the amateurs from their most active bands. I'll grant that
just about anything's possible in government, but that by itself doesn't
mean it's necessarily likely to happen.

>It is purely a matter of economics. 2 meters and 70cm are woth tens of
>billions of dollars in corporate profits to any industry that can grab
>the bands from hams. We are at war for our survival!

Yes. But if the corporations did take over the bands, then the
Technicians wouldn't be able to fulfill your prognostication that they
would live out their entire amatuer careers on a single two meter
repeater, and you would finally have to admit being wrong about that. :-(

I got one for X-mas in 95. So far I am happy with it. It does have
expanded receive, but as with all 2M/440 rigs with expanded receive, you
do not have as tight of a receive as you would like.. But over all, it
is a good rig.

Pretty straight forward. The LCD will display a number less than 10. You have to press a number that when added to the displayed number = 10. After pressing your number, hit the F key to enter it. The game will slowly increase in speed... That's all.

Generally the off-set is 5 Mhz, but that could vary in some parts of the country. Might be that the machines use a subaudible tone for access, 103.5 hz etc. If you don't have a repeater directory than you might try searching the Internet I think their is one. Don't have the address.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Greetings. I am looking for a copy of the manual and schematic for the KDK FM-4033 220MHz mobile rig. My radio needs service, as the receiver is off-frequency by about 100Hz, and I don't know where the RX frequency adjustment is located (if it indeed has one). Right now I have to tune off freq. with the RIT 100Hz to work a repeater. Funny, though - even though I'm dialed off for the RX, the TX is still dead-on, split and all. Maybe this rig has a real RIT circuit (hi-hi). Any help here is appreciated, and I'll be glad to reimburse any expenses incurred for the copy and postage.

I don't think this is a good way to go. I'd suggest programming to a common API spec such as the Clarkson packet driver API for those still stuck in the DOS world, or just use a ptty or a socket interface under a real OS. Using a PC as just a TNC is overkill even at today's low PC hardware prices. You might as well make the PC do everything since it doesn't cost much more to equip it to be a real machine. Basically you need to add display, keyboard, and a hard drive to your "PC TNC" to make it do everything. That's cheaper than having to have another computer emulate a dumb terminal. And if a real OS is used, real applications could make use of the radio network linkage in an efficient and tightly coupled manner.

>The PC configuration would look something like this:
>
> - Sound Blaster DSP card

AFAIK the Sound Blaster "DSP" isn't user programable at the level of running modem code we might write. The Cardinal soundcard with the PSA chipset *is* a fully programable DSP, but they're hard to find. Generic sound cards are only useful for ADDA conversions, with the main PC processor doing the actual DSP number crunching. For a fancy modem, that means a Pentium with MMX extensions. For more mundane modems, a 486 will do. Fortunately, the latter have gotten cheap. We need to walk before we can run, so our initial activities should be aimed at implementing simpler modems anyway.

I think we'd like this to run on generic hardware so that anyone with a PC and sound card can play. That limits us to less than the most exotic DSP modems, but we can still do a lot with this. By the time we need more processing power, Pentiums with MMX should have fallen in price to the point where a motherboard transplant won't be painful to "everyham" (we have to keep in mind the multimedia laptop users, however, they won't be able to do a "brain" transplant cheaply, so we need to keep the reference platform at a reasonable level for quite some time).

> - 4 Megs of RAM

Might as well have 16M, memory is cheap now. You can run Linux in
4M, but it thrashes a lot. A large memory store also lets you run
a really fancy memory ARQ, IE you can rescan the raw data several
times in several different ways to piece together valid packets
without having to force a perfect packet through over the air by
multiple repeats.

>I would like to see it support HF Modes (RTTY, ASCII, AMTOR, PACTOR),
>SSTV, FAX, VHF Packet, and also the satellite modes like BPSK.

Well, most of that is available in one form or another already.
The challenge would be to pull it all together and make it work
in a user friendly shell with a consistent interface. That's why
you want the modems to conform to a common API, then one consistent
shell can access any mode. (That's basically how the HAL P-38 works.)

>Unfortunatly, I don't have that much DSP experience to do this or I would
>have done it already.
>
>If anyone is interested, lets start the project! I think it could turn
>out to be very fun.
>
>I'm willing to start a mailing list on my machine to kick of the discussions.

I think a collaborative internet project would be an excellent idea.
The open model used by GNU and Linux has shown that such projects can
work, and produce excellent results. I think we need to define our
objective fairly closely before we jump into this too heavily, however,
and I'd note that the TAPR HF SIG and DSP SIG are in some senses
duplicative of any possible mailing list we might establish.

Let me give you my vision of the PC for "everyham", including modest
DSP capabilities, and see how much interest it attracts (and how many
brickbats too, there are holes in these ideas).

First let me define a reference platform as a base for "everyham".
Faster and more elaborate platforms can participate too, of course,
but there has to be a floor below which we won't try to go simply
because performance becomes too limited. With that thought in mind,
here's my idea for the base system.

PC motherboard: 486DX4-100 minimum

Discussion: These are cheap, and about the lower limit for effective
PC DSP. A 586-133 might make a more reasonable base unit, and a P90
or faster would obviously work, but Pentiums are still more expensive
than most hams will devote to an amateur project. (That could change
in a matter of months, however. We have a rapidly moving target here.
We need to flog this out throughly before starting coding.) We shouldn't
make any of our code dependent on a particular processor clock rate,
so that it can painlessly migrate to faster hardware as prices fall,
but we do have to have some minimum rate below which we won't go.
I think the 100 MHz level is as low as we dare go.

Sound card: Generic Soundblaster "compatible"

Discussion: these are cheap and available everywhere. They aren't really clones of the real Soundblaster, and we will really only be using them for A/D and D/A to get the analog signals to digital form and back so we can process them. We don't want to tie ourselves to a specific brand or model of sound card because this too is a rapidly moving target. Example: the excellent Cardinal sound cards with the PSA chipset have virtually disappeared, dumping most of the coding work that has been done for them down the bit bucket. If we stick to a generic card used only for ADDA, we can avoid this obsolescence for quite a while longer, though we limit the ultimate performance we can achieve. A 44 kHz sample rate should be sufficient for anything we'll attempt to do with voice grade radios, and 16 bit sampling should be sufficient for our needs too.

Note that a second generation DSP plug-in card could be added for higher performance uses at a later date without obsoleting our PC platform as the control and display element of the system. We'd just add a driver stub to tie it to our standard API.

Memory: 16M base

Discussion: There are lots of 30 pin SIMMS floating around out there in the 1M and 4M range which we can acquire for a song, but motherboards that use them are becoming scarce as new product. We need to assume a 72 pin SIMM, and 16M is currently the most cost effective size. Why so much memory? Why not? It makes economic sense today. This is a moving target, but 16M is enough to run an effective OS and major application programs.

OS: Linux

Discussion: This is a hot potato. In one sense, a program loader like DOS has the advantage of getting out of the way and letting our DSP code run full throttle. But in another sense it isn't really cost effective to have a full PC just do a modem function, and a monolithic "do everything" program can become so large, clumsy, and intractably bugridden that it can kill the effort, so we need the ability to break the tasks into manageable segments with defined interfaces and multitask them. Windoze won't do, it is too clumsy and almost assures data loss and system crashes. We need a robust protected mode environment with a predictable scheduler. QNX might be ideal, but Linux is practically free, and is a completely open system (if we decide we need totally deterministic scheduling, we have the source code for the scheduler and can make it so). I think it is the ideal platform for *amateur* work. There are already a number of amateur radio applications running on Linux, and there is a robust software development environment available for it at no extra cost.

Development software: C++ with assembler boost

Discussion: We have the excellent GNU C++ and assembler available to us for no extra cost, these are the native tools of Linux

and most of the rest of the software world. We can do effective
DSP coding in C++ (with the critical sections committed to hand
tuned assembler following the 90/10 rule).

As a wildcard, let me suggest that the user interface should be Java
applets running in a browser. Java is rapidly becoming the "universal"
user interface language, and the browser paradigm appears to be the
next standard in user interfaces. This will make the learning curve
short, and will maximize portability.

I suggest we bury the DSP modem code and protocol code in a series
of driver and server processes and communicate with the browser applets
through a network standard API. This is clean, and allows us to migrate
to other platforms as they become affordable. This can also allow us to
implement client/server in a network transparent manner, allowing us to
run the DSP on one computer while operating it from another computer on
a local LAN (or even across the internet).

Now this sounds like a huge job, and it would be if we tried to do
it as a monolithic program, but we can break it into manageable pieces
in the Linux environment as long as everyone agrees on the APIs between
the various modules (and C++ tends to enforce that). Thus we can have
small teams each concentrate on their small piece of the project without
becoming overwhelmed.

The one thing we have to get right the first time is the overall
system design. If we choose the division of tasks and module interfaces
unwisely, we'll have an unmanagable mess that we'll never be able to
sort out. But if we do it right, we'll have a flexible and extensible
system which can serve us well far into the future.

786. FS: Heathkit SB-1000 HF Amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-10 00:00:00 UTC
From: Larry Menzel <lmenzel@millcomm.com>
Message-ID: <32D6A8F1.5546@millcomm.com>
Source record: 186530

I have a very clean, last edition Heathkit SB1000 HF linear for sale.
Built by a very fussy Extra Class op. it is well done.

The only reason I'm selling it is that I'm replaceing it with an AL1200.

This amp has a new power supply transformer and a fresh 3-500Z tube.
Covers 10-160 meters, and puts out 1000 watts key down on 40-160 and 850
watts on 10,12,15,17 and 20.

It's in good condition, a few minor scratches on the top, and works
perfectly.

I will also include an Ameritron QSK solid state board, never installed,
with the deal.

email me at lmenzel@millcomm.com for more information.

Just for information NO Amateur transmitter ever gets tested by the FCC or a testing lab for the FCC. All the manufacturers have to meet is the exact same Part 97 specs as if you built the transmitter. The receiver is the problem. When the Amateur radio that receives above 30 MHz, actually gets tested and accepted as a SCANNING Receiver. The FCC database shows amateur receivers as scanners. The receiver must pass FCC Part 15 for receiver radiation. This is so your amateur receiver does not interfere with your or the neighbors TV or VCR. One would think the transmitter would be tested for spurious products, but they are not. Makes for interesting conversation. Look at your HF radio, you will not find any FCC ID Numbers on it, only your radios that operate above 30 MHz and HF Linear amplifiers.

Your are correct it is the 6 meter receiver that the FCC is testing.

```

Nonsense. Having used the lot, I have to reluctantly tell you the C558 has nothing like the versatile frequency coverage of the more recent radios. It is, however, much more the hacker's radio because it permits the user to do almost anything. Nonetheless, the FT-50R is the most frequency agile, while the FT-51 is second best. The Icom is a creditable effort, but has some immunity problems which the Yaesus do not exhibit.

<<Looking to finally get my hands on a tuner,

If I remember the ts520 correctly, it is a rig with tube finals and a pi net output. That should match a single band coax fed dipole without a tuner.

However if you want all bands, then feed that dipole with open wire and get a tuner with a balanced output. A tuner rated at 300 watts should do you ok. If any arcing or smoke then lengthen or shorten the feedline or antenna and try again. Cut and try is the name of the game on these antennas but their cheap and do work,

>
> -=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=- I agree with you,
not many hams, know this, since a large
abundance of HT users are not Engineers to appreciate the
designs, but as an radio Electronic Engineer, I can say the
FT50R is the real winnner.

1.) For those who want to be enlightened, the FT50R has a
unquique desined front end for both VHF and UHF that utilizes
a varactor tuned 2 stage filter driven by the CPU.
This allows the front end to get less intermod for wide band
reception!!
Most of the intermod resistant radio's need narrow band
```

filters on the front end, but are not good for wide band
reception, the other manufacturers will claim wide band,
but can not claim good image rejection to signals that you
listen to when you want to listen out of band.

2.) The AGC is much superior in the FT50R , instead of AGC, to
early like Kenwood, Icom they do it futher back to insure a higher
dynamic range for the radio.

I had a TH79AD, W31A/W32A, got rid of them and very pleased with
the FT50R. I can say that this HT outshines the FT51R in its superior
out of band reception on VHF/UHF.

If I was Yaesu, I would not change anything electrically in the
FT50R!!

I wish it has a wider filter for FM, 88-108Mhz , but in Japan
they use narrower FM. It may have some points of concern from
those use to V/V or U/U , but if you compare, its design is
about 1year ahead of the other manufacturers.
I can almost guarantee that other manufacturers look at
each other radio's and get ideas to implement for their newer
radio's.
I would say this engineering competition of providing the
latest and greatest rather evolutionary. A manufacturer
knows that features, performance, can be crucial to the time
a radio is introduced. One can capture the market for a 6month
to 1 year span, then their competition out does them. It goes back
and forth this way as each trys to acquire a % of the market place.
For right now the FT-50 is on top, 6months to 1year from now, who
knows, there is be some revision , copycat , catch up , or
dominance by the competion.

All you FT50R users , have fun, I have mine..

I'm looking to buy a used spectrum analyzer.
Maybe the HP 141T/8552B/8553B. Anyone know how old they are?
Lowest price I've seen is $1200. Is it worth it?
Any advice would be appreciated.

Thanks,
Brett

Quite right. We all want clean safe streets and good schools,
libraries and hospitals. But why should we have to pay for any of
them? Many politicans believe that voters are so disconnected from
reality that a promise of less taxes is a certain vote winner, and
all the posts in this thread appears to justify that cynical view.
This also explains to me why the Make Money Fast threads never end.

go to www.itis.net/eqf, download the LOG-EQF logging
program, if you use Kenwood rigs, also get the RIG-EQF
, is a completer rig control program for Kenwood rigs.
Follow the Docs for setup under windows. I've used the
program for many years, its the best. 73 Bill, KG8AW

Thanks for reading....

I have a super mint condition Kenwood TS440SAT for sale. It also has the following features installed: YK88-C 500Hz CW Filter, YK88-SN 1.8kHz SSB Filter, VS-1 Voice Synth Chip, TU-8 Tone Unit. It comes in its pristine boxes with full manuals and original packing.

It's a terrific first rig, or just a great radio for casual use.

I'd really like to sell it to someone who would really cherish it. However, as a last resort I will sell it to AES as used equipment only to see them spending time and money bench testing an already perfect rig and then selling it to some person for an overly inflated price.

If you know of anyone (a good friend, perhaps) who might be looking for a terrific rig at a terrific price, please let them know about this one!

Please reply via Telephone, Email or Packet and NOT TO THIS NEWSGROUP.

Hope to hear from you soon.

Assume that LEOs or some equally horrible creatures get 2m and 440.
What wold happen if we just continue to operate? The FCC is not about
to enforce the rules on us there any more than they enforce the rules on
11 meters. Of course, we would have to shut down repeaters, etc.,
because they are vulnerable to DF'ing. But who's to shut down 500,000
hams who just keep on plugging along on simplex FM, SSB, and (gasp!!)
CW?

Kind of gives me a thrill just to think about it.

816. MFJ989C Antenna Tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-11 00:00:00 UTC
From: "ir003432@worldnet.att.net" <ir003432@worldnet.att.net>
Message-ID: <32D84E64.5F17@worldnet.att.net>
Source record: 186289

The MFJ989C tuner has problems. Mainly, the construction is flimsy. I bought one and, when it arrived, something was rattling around loose inside. I opened it up and found:
- The roller inductor WAS NOT EVEN BOLTED TO THE CHASSIS.
- The variable capacitors were not aligned with the front panel holes and they would not rutn without binding.
- A couple of the connections on the antenna switch had never seen a drop of solder.

I fixed it up and have used it since, running as much as 750 watts through it with no problem.

If I had it to do over again, I would:
1. Build my own. Use plans from ARRL Antenna Book or Handbook. Get parts from ads in QST, 73, or CQ or hamfest.
2. Buy a good old Johnson Matchbox. The Matchbox it the classic antenna tuner, came in 275-watt and 1-kw versions. They are tough to find, not cheap, but they are worth the effort. I have just purchased a near-cherry 275-watt Matchbox and have retired the MFJ.
3. Buy the Vectronics tuner from Turner Electronics. I saw one and it's impressive.

The best antenna tuner ever made was the old Johnson Matchbox. It came
in two versions: 275-watts and 1-kw. They are hard to find and are not
cheap. If you find one, open it up and look to make certain no one has
screwed around with it. Also, need to get a manual and try to find one
with a directional coupler (that is, built-in forward/reflected power
meter).
Stay away from the MFJ tuners. They are flimsy.
The Murch transmatch is fine old tuner, too.
The Heathkit SA-2040 is not bad provided the builder did decent job with
it.

THE YAESU FT-990 WILL BE CLOSED OUT NEXT MONTH!!!
The FT-990 was A great rig (I owned one). It is older technology.
The Icom 756 is $2150 from some dealers. The Ts-570D is $1550 AND
Kenwood just came out the TS-570S (includes 6 meters for $250 More).
I don't kwon what the new rig to replace the Yaesu 990 will be like?

This may not be entirely true. The ever modest Wayne Green in a 73
article many years ago reported on an interview with Gen. Curtis LeMay

the following: Le May is reported to have said (with many expletives deleted) that (the military) want the hams to keep their bands because in time of conflict we (the military) can quickly take back the ham bands, but the commercial people will fight tooth and nail to keep their frequencies. ...So you see, we may have more friends in power than the commercial interests. Perhaps we need to remind the military of this from time to time and keep them on our side. If you know military hams, advise them of this point if you think it is correct. Sgd. Neil AB4YK.

Yes, the offset for UHF is 5 MHz. Most of the US places UHF repeater
outputs between 442 and 445 MHz, with the inputs between 447 and 450 MHz.
That would be a "+" offset. But in some of California and much of the
northeast, some of the repeaters are upside down from that.

>intersting to read. where is the 70cm band placed in the us ?

FM repeaters generally operate between 442 and 450 MHz in North America.
In the busiest cities repeater activity has pushed down to 440 MHz. The
standard offset is 5 MHz. Of course, some people have to be different.

A friend of mine is looking for any and all information on the GLB synthesizers kits models GLB-300 and the GLB-450A. The 450A is the universal synthesizer, which can be used on any band. I believe he said the 300 can only be used on two meters.

If anyone has information on these, I'd appreciate hearing about it.

Thanks and 73's

Larry,

I got one. It works very nicely, especially in that it has an auto-range feature: I can use it with my QRP and QRO rigs without pushing a button (or, in real life, without pinning the meter and cursing). The only problem is that it is not very well suited for tuning... although it has an SWR bar graph in addition to the digital display, it reacts too slowly. I still use an analog meter when adjusting the antenna tuner.

BTW, how much is it on sale for? I think I'm still in the price guarantee range and maybe can get a few bucks back!

By ELAINE WALKER
Herald Staff Writer

The would-be owner of Hollywood's police radio tower has a penchant for collecting discarded police radios and communications equipment that keeps landing him in trouble.

Alan Leonard, a felon out on parole, is being investigated by the FBI for computer fraud and copyright infringement. That was news to Hollywood
city officials, who managed Monday to get Leonard to drop any claim to the police tower.

``The city doesn't want to have anything to do with people like him,'' City Manager Sam Finz said. ``The good news is we're not going to be Doing business with him anymore.''

According to an affidavit filed Dec. 10 in U.S. District Court in Miami by FBI Agent Kathleen Antona, investigators believe that Leonard may be manufacturing and cloning Motorola radios, then selling them as the real thing.

Reached at his home Monday, Leonard declined to comment. ``I would really like to talk to my attorney before I go any further.''

The FBI raided Leonard's Miami home and the offices of his business, Communications Electronics Engineering of Miami, on Dec. 13. A collection of Motorola radios, computer equipment and diskettes was seized.

As of Monday, the FBI has not filed any charges against Leonard, and the investigation remains ongoing, acting spokeswoman Anne Figueiras said.

``I don't believe we've done anything since the search warrant was executed,'' said Figueiras, who would not discuss the nature of the investigation.

Documents show that the FBI investigation began in January 1996, after a call from Joe Krause, an attorney for Motorola.

Krause told the FBI that he suspected that Leonard was in illegal possession of Motorola software, which he was illegally using to program Motorola radios.

After Krause's complaint, the agent Antona, who specialized in high-technology crime, turned her attention to Leonard's business practices.

Antona's review found probable cause to believe that more than eight times during the last year, Leonard has assembled Motorola radios from used or scrapped Motorola radio parts, federal court documents show.

The FBI claims that he then used a computer and illegally acquired Motorola software to program the radios, which he allegedly sold as genuine Motorola radios, without permission from the company.

``Alan Leonard has willfully and for purposes of commercial advantage and private financial gain embarked on a scheme to defraud Motorola and Motorola's legitimate customers,'' Antona wrote in her request for a search warrant.

Antona also found probable cause to believe that Leonard made unauthorized changes to the radio programming software contained in the Motorola radios.

The changes give Leonard the capability of producing, using and selling radios that can access -- illegally -- the Motorola communication system used by the FBI and other local law enforcement agencies, the affidavit said.

This is not Leonard's first brush with the law.

He was convicted on charges of second-degree murder, conspiracy and attempted robbery with a firearm for participation in the Feb. 17, 1978, attempted robbery at the Round Table Restaurant in Coral Gables. Leonard's two companions in that incident -- one of whom was a police informant -- were killed in a shootout with Coral Gables police.

Leonard's parole officer, Nanette Russell, told the FBI that during the past few years she has received inquiries from at least three South Florida law enforcement agencies about Leonard's business practices.

The inquiries concerned Leonard's allegedly illegal operation of businesses where he sold police equipment, badges and ``police-type'' portable radios.

By comparison, Leonard's controversy in Hollywood is small scale.

Leonard claimed that the police communications tower was part of a collection of surplus communications and radio equipment that he bought from Hollywood in December 1995 for $500.

After vowing last week to fight for the tower, Leonard suddenly backed off at a meeting Monday with city officials. He signed an agreement releasing any claim to the police tower -- or any other towers owned by the city.

Finz said Leonard told city officials Monday in a closed-door meeting that he realized that the police tower was never supposed to be included as part of the surplus equipment.

They carry Eimac, Amphenol, and their brand (China made). They are pushing the graphite plate versions. Anyone have used ones or nearly used for sale? 73 Steve AG4W

843. Re: FT990 vs Kenwood 570 vs. ICOM??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-11 00:00:00 UTC
From: Dave Burr <dtburr@mcs.com>
Message-ID: <32D7CAEB.304A@mcs.com>
Source record: 186337

Dave:

Although I have not owned these *specific* rigs, I've owned a number of late model rigs offered by each manufacturer--- IC-737, TS-850S, FT-1000D (played *extensively* with an IC-775 before deciding on the FT-1000), and a zillion other Icoms and Kenwoods before these.

This is my opinion, of course, but I think you may find several who agree, at least with some of these points:

*Most sensitive reciever, generally Icom (can't say about the '756...it's not out yet.

*Best receiver in terms of "cleanliness" and overall quality. The nod goes to the '990. I'm not a huge Yaesu fan, but I have to give it to them on this.

*Best transmitted audio, probably the Kenwood, although you'll get a few arguments from fans of other mfrs. You will need to throw the Kenwood mike out the window first, though. Also, keep in mind that if you want a better mike, like maybe a Heil or something, it will not work well with an Icom unless you modify the rig. This is true with the '756 as well.

*Most thoughtful design from the standpoint of ease of operation...the '990. It doesn't take a rocket scientist to see this. But hams generally want a densely packed front panel because it is fun and looks cool. If you are a contester, this is no good. I might add that moving functions to software is not always great solution either. That is the way the '775 works and to some degree the '756. You will find that some frequently used settings on the Icoms will require your going into a "set" mode (even on the extremely busy '775, which has 500 buttons and knobs!). Kenwood tends to pack all the controls on the front panel and only have the least used functions on software. Yaesu makes the rig a little bigger, and then give you knob and button combinations to set some lesser used settings without going through a menu system,which is a somewhat sensible approach. All three approaches have merit.

*Worst build quality, Icom. I LOVE Icom rigs and have owned more Icoms than any other, but the 737 was a trainwreck, and I see the '775 the same way. There have a been a ton of problems with '775s. Again, maybe the '756 will be better.

The net: If you need to buy a radio NOW, buy the '990. (set the '570 next to it just for fun..the 570 will look like a toy) If you can wait, check out the '756. It may be a great rig, albeit a riskier purchase.

I will also note that DSP on most rigs works in the audio stage and an outboard DSP can be used if you want that capability with the '990. I would recommend DSP capability in receive because a good algorythm can work miracles when the QRM sets in.

It will be interesting to see the other opinions. Good luck!

Turn off the radio

Press and hold the B+# buttons while turning on the radio, and continue to hold these buttons for 5 seconds after power up.

Now look in the set mode for a new function labled 1 PLACE

Turn both main tuning knobs until you see 100 PLACE in the display.

You have now enabled wide receive with aircraft coverage and 6 digit direct frequency entry.

Cross-posted to: alt.forsale,sci.electronics.components,misc.industry.electronics.marketplace,,rec.radio.amateur.equipment,sci.electronics.repair,sci.electronics.equipment,us.forsale.misc

I have TWO Zetron Model 50 DID Telephone Trunk Converters for sale.

These both are in BRAND NEW CONDITION. They were in use for less than a year.

A DID (direct inward dial) line allows each mobile radio or pager to be reached at a unique, seven-digit telephone number, just as in cellular service. A caller doesn't have to overdial extra codes in order to reach a radio or pager.

They were designed to be used with a Zetron Model 45B (Z-Patch), 46 (Trunked Interconnect) or Model 48B (Repeater Manager) but will work with ANY DID installation.

Rack-mount. All manuals included.

This allows each subscriber to have his own unique telephone number!

Original price was $1,000 each. Willing to sell for $1200 for both or $700 each -- OR BEST OFFER.

email: kgold@telerama.lm.com

Kory:

Not a stupid question at all. I just find that the objectivity offered by real users can be helpful. They tend to give a better story about the deficiencies in a piece of equipment that can be solved through an upgrade or mod. In the absence of this info, I certainly would talk to Yaesu. After all, some info is better than no info.

Telescoping Mast for sale
in San Jose, CA.

37 foot Telescoping Mast, material is schedule 80 PVC Tubing,
in 4 sections, with O.D's: 3.50", 2.75", 2.25", and 1.75". The
sections are held in place by a u-clamp and thru center eye-bolt
arrangement. Each u-clamp has 2 outer eye-bolts, along with the thru
center eye-bolt, which are used as guy points.

The bottom 3 sections use PVC sched 80 reduction union joints (very
beefy) which I reamed out to allow upper sections to slide thru
freely. The three over-lapping sections are over lapped by 12, 16,
and 18 inches, from smallest to largest dia., respectively. Each
upper section has 2 sets of 3 spacer bearings that take up the
excess play inside each over-lapping section.

As you may well have gathered, I have an Engineering background
and took some time designing this Telescoping Mast. It wasn't
something I just threw together.

The last 2 years in San Jose, CA, has brought storms with winds as
high as 75 mph. This Mast barely moved during these storms. Also, I
use three sets of guys which are marine-type nylon rope that is UV
resistant.

Mast is more durable and can withstand higher wind speeds than
a steel mast, when guyed properly. Also, Mast doesn't interact
with antenna like a steel mast would.

i have kenwood's tm-733 since over a year. the first rig
always looses the memory, if i started the motor.
(sorry - not the memory, only the contents of the memory - hi)
but it was in gurantee, the rig was changed and this one
it workes perfectly.

and dont forget: the tm-733 is designed as mobile-rig (or
maybe fix station for phone) - not for 9k6 packet radio.
even if there are connectors for it.

>>
>>Thomas M. OZ2AFO.

>display faster. The 733 & 732 have too many features for easy mobile
>use. It is easy to forget keystrokes for unusual features unless using

o.k. - thats right. if you want to program the rig, you need the manual.
so i have it placed in the car. (unpossible to remember all the things)
but for mobile operation, what do you really need ?
only 3 keys: the pf-key for switching the ham-band
and the up and down keys on the mic, for switching between
the programmed repeaters. thats it - just easy to use.

This reminds me of someone that KD1HZ and I know who stuffs his FT-5100
between the seat and the center console of his Ford Explorer. Not pretty
but somewhat effective. In his case he wasn't a serious ragchewer so heat
wasn't a problem.

857. Alinco DX-70 Noise Blanker

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-11 00:00:00 UTC
From: Bill_Combs@mgdmug.ORG
Message-ID: <0513.199701111425.005012F2@mgdmug.org>
Source record: 186351

I have a friend who has an Alinco DX-70. He had some problems with the rig and had to send it back. They updated the noise blanker for him to some newer version which Alinco said they changed after serial no. 1000. The new blanker works but
it distorts at very low signal levels, S3 or S4, and the distortion is very bad.

Any suggestions?

Source record: 186353

The comparable Kenwood unit to the Yaesu FT 990 is the Kenwood TS 850, not the 570. I researched the TS 850 vs. the FT 990 very carefully by getting the QST and CQ magazine reviews and MY interpretation of those reviews indicated to me that the TS 850's receiver had the edge. So I bought one and have been thoroughly satisfied with its performance. Since Kenwood is discontinuing the TS 850 (being replaced by the TS 870 with IF DSP), the price for a new one has dropped and they are very affordable now. 73 de John, K7JY.

I suspect that since Gingrich's call was a conference call, that one of the participants was on a cell phone (in FL) while the others were using what they thought were secure phones. Shows how one weak link in supposedly secure links can compromise the whole thing.

A bigger problem for us is that new laws and stronger enforcement of anti-monitoring regs will probably follow.

Bill;

Tens of billions of dollars??! And what fine piece of analysis work do you base this claim on? This is pure hysterics, IMHO, just more Chicken Little-like "Sky is Falling" crap with no supporting evidence to back it up.

Are there people and organizations out there that would like to grab up our spectrum for their own use? You bet there are. But if it were really worth "tens of billions of dollars" we'd have lost that fight long, long ago.

Our tiny chunk of spectrum at 2m and 70cm is barely usable by modern data communications standards. Any organization that can afford to get its own LEO bird on-orbit can easily afford SHF gear to communicate with it much more reliably than with VHF/UHF links. I think our claims to bandwidth at 2 GHz and above are far more at risk from these sorts of operators.

If it's all Collins and has the modified IF, along with the covers and meters, it could be worth up to $750.00 depending on condition. I put an ad in Radio World to sell a Stewart Warner R-390A for $600 and got responses from all over the world.

Reminds me of when I lived in NH, near Mass border. The Mass. tax
agents planted themsleves in the parking lots of the NH liquor stores
just off I-95, and when the driver crossed back into Mass, ZAP!

What ever they can get away with, they'll do...

889. Re: IC706, hole in back panel

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-11 00:00:00 UTC
From: Bill N9HH <billnihh@apci.net>
Message-ID: <32D83315.496C@apci.net>
Source record: 186383

I have not pulled the plug to look, since the radio is in my car which is sitting outside with a minus 35 degree wind chill factor, but the exploded diagram in the service manual shows the hole. If it is for access to something, it would have to be on the filter board, or on the PA board toward the back of the radio. The filter board mounts with the component side down and the rtty and remote jacks are on it just above the hole. There are some relays behind the jacks, so it doesn't look like there is anything to access there.

The exploded diagram doesn't show any holes in the casting that would allow access to something on the PA board.

It is near both the accessory and the rj45 mic jack, maybe it was meant as a standard jack for accessing some of those connections?

Any other ideas?

895. Re: FT-50R Digital Battery Voltage?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-11 00:00:00 UTC
From: tnic <tnic@styx.ios.com>
Message-ID: <5b6ud5$722@nnrp1.farm.idt.net>
Source record: 186449

You can use the menu to dislay the battery voltage. It works pretty good
you can see the voltage dropping when your transmitting. Once you work
with the radio a while you have a very good idea when your battery is
dying. I like it. There is also a small battery on the display when your
battery is getting close to dying.

Jim Kauppila <jimae4hl@internetmci.com> wrote:
: How does the digital battery voltage work on the FT-50R?

: Also I see what looks like a speck of plastic between the lens and the LCD on the upper

Something similar happened here in Pennsylvania some years ago. A
purchase had been made in New York, and the purchase was a gift to me.
Some time later the NY tax folks sent me a notice. A lot of PA folks got
them and the PA Dept. of Revenue was called, as was the state Attorney
General's office. The PA state folks essentially told the NY state folks
to "go ---- -- - ---!" and NY backed off. No one I know ever paid any
tax to NY in this matter.

Telescoping Mast for sale
in San Jose, CA.

37 foot Telescoping Mast, material is schedule 80 PVC Tubing,
in 4 sections, with O.D's: 3.50", 2.75", 2.25", and 1.75". The
sections are held in place by a u-clamp and thru center eye-bolt
arrangement. Each u-clamp has 2 outer eye-bolts, along with the thru
center eye-bolt, which are used as guy points.

The bottom 3 sections use PVC sched 80 reduction union joints (very
beefy) which I reamed out to allow upper sections to slide thru
freely. The three over-lapping sections are over lapped by 12, 16,
and 18 inches, from smallest to largest dia., respectively. Each
upper section has 2 sets of 3 spacer bearings that take up the
excess play inside each over-lapping section.

As you may well have gathered, I have an Engineering background
and took some time designing this Telescoping Mast. It wasn't
something I just threw together.

The last 2 years in San Jose, CA, has brought storms with winds as
high as 75 mph. This Mast barely moved during these storms. Also, I
use three sets of guys which are marine-type nylon rope that is UV
resistant.

Mast is more durable and can withstand higher wind speeds than
a steel mast, when guyed properly. Also, Mast doesn't interact
with antenna like a steel mast would.

I have the Yaesu FT530.. .. it does TX from 110 to 180 and 400 to 470
and of course has AM rx. Just open it up and cut the green wire
and do a CPU reset. I have used it many times for X-band repeat
and it does a great job. I love the way all of the functions
on the 530 work and I don't think there's a thing about it that
I would change.

I have been using LogEQF for awhile, and it seems to fill the bill. It does all you stated, I think, plus interface to most computer controlled rigs and packet cluster. It is a DOS based program that runs just fine in a window on 3.1 or win95. That's one of the reasons I like it--I often use an old 286 laptop with the radio, but I can run the program on one of the more modern computers without dropping into DOS.

Shareware versions are available and they seem to be much more functional than alot of the brain dead tryouts floating around for others. I think registration is only 35 bux. N3EQF has a web site, but I don't have the URL handy. Try a search, or email and I'll dig it up.

Have you seen this before?

My HR2510 does not shift to XMIT when PTT is depressed. I have the service manual, but this "orginal" from UNIDEN has a schematic which is not very legible. I think I have it isolated to the OP-Amp that takes the PTT volts and sends the toggled voltage to the transmit and receive circuitry...but without a good copy of this schematic, I can't be sure. Anyone seen this failure before?

I Have one Zetron Model 810 Digital Hybrid for sale. This is a 2-Wire to 4-wire converter with digital signal processing. It typically is used to connect a standard telephone line to a mobile radio system. It will enhance the audio (especially full-duplex) in trunking, conventional and cellular radio systems.

This unit is in excellent condition. It was in-service for less than a year.

Rack-mount (about 2" high). With Instructions.

Originally purchased for $900. Will sell for $600 OR BEST OFFER.

email: kgold@telerama.lm.com

I seem to remember a news report from a couple of Christmas seasons ago
that told of NY state revenue agents scouring the parking lots of
northern NJ malls and placing notices on the windshields of cars with NY
plates "reminding" the car owners that purchases they make in NJ are
still subject to the higher NY sales tax rate and that it was their
"responsibility" to pay the difference to NY state. I have also heard
stories about NJ state revenue agents doing the same thing in the
parking lots of outlet malls in nearby Delaware (which has no sales
tax). Talk about crass!

929. FT990 vs Kenwood 570 vs. ICOM??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-11 00:00:00 UTC
From: dgshively@msn.com
Message-ID: <01bbffda$226ddf80$25392399@default>
Source record: 186483

Greetings,

I'm currently trying to compare the Yeasu FT990, the
Kenwood 570 and whatever ICOM is in the same sort
of price range. I would guess that this would mean
the ICOM 756 but from what I recall the price is about
$500 more for the ICOM.

I am currently leaning towards the FT990 - has anyone
had any problems or concerns about this radio?? The
Kenwood also looks good and has DSP (on the audio
not the IF) but it looks like more of a mobile/base rig
and probably doesn't have as good performance as the 990.
However, from what I recall the 990 doesn't have any
DSP at all. I don't have any direct experience with
the ICOM rigs so I don't really have an opinion right
now except for the matter of increased price for the
ICOM.

I guess what I'm looking for at this stage would be
any seriously negative opinions about any of the
above mentioned radios. Comments like "I would
never buy an FT990/Kenwood 570 becuase ....."
might be helpful.

Thanks in advance and have a great New Year!!!

>>> N3JZK wrote:
Can anyone give me feedback on the model 212 2m mobile that Radio Shack is clearing out? Any known problems? Does it have expanded receive? My local store DOESN'T have all the answers!

N3JZK >>>

I use a 212 as a base unit and love it. I've heard they are clearing them out and replacing them with the 242. If I'm not mistaken what you gain with the 242 that the 212 doesn't have is twice the memory space <20 to 40> and the ability to store other freqs outside of 144-148 in memory which you are not able to do with the 212.
Oh and yes, the expanded receive <on my 212 anyways> is 136-174mhz. As far as any problems, I've never had any. I have heard other ops complaining that theirs had very low mic audio and had to take it back and try another but, didn't take long to find one.
I bought mine when they were expanding the warranty from 3 to 5 years. So, no matter if it's a faulty board or if you drop it on the way out to your car, just take it to any Radio Shack and they will repair it That was an additional $40 for the coverage if I remember right.

73,
Terry

Hello,

I am interested in buying an AR3000A PLUS (the modified AR3000A which
includes a switch for wefax reception). Please let me know if you have one
of these and would like to sell it.

Thank you,

Jim
jburrell@inst.com

M>intersting to read. where is the 70cm band placed in the us ?
>in europe it is from 430 - 440.
>most countries have a shift of -7.6 meg.
>some have +1.6 meg.

Our whole allocation in the US is from 430 to 450 MHz. The repeater
sub-band is from 440 to 450 MHz. 420 to 430 is mostly used for ATV.
430 to 440 is used for ATV and weak signal and packet. Few repeaters
are in that sub band.

From: Gene Benzing <gbenz@kcaccess.net>
Message-ID: <32D9C586.7A10@kcaccess.net>
Source record: 186247

I have to following amateur equipment for sale:

Yaesu FT 990 HF all mode transceiver.

500Hz CW filter

2.4Khz filter (all except FM)

Internal automatic antenna tuner

Internal power supply

Bencher keyer

Yaesu MD-1c8 Desk Mike

In original carton, with all manuals. Will ship in US prepaid/insured.

Terms: Cashiers check or bank draft only. No personal checks.

Price: $1500

Note: This is well below what AES or Ham Radio Outlet asks for used FT

990. This radio has only seen very light occasional use since purchase 1

year ago.

If interested, e-mail only please to: gbenz@kcaccess.net.

Search the net for a program called Paket (correct spelling without a "c"). I recently found version 6.1 but didn't keep the web page address. If you can't find it e'mail me and I will send it as an attachment. It is 902,155 kb. Paket has a setup for several different multi mode manufacturers. It includes dedicated key functions that you won't get with a communications program.

951. Want Your Ft50 rdf file

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-12 00:00:00 UTC
From: "Paul R. Saffren" <psaffren@pacbell.net>
Message-ID: <01bc003b$6def48c0$218b68cf@psaffren>
Source record: 186321

I just bought (thank God for plastic) a new Yaesu FT-50R (HP) . Turns out
this unit has the newer firmware
which appears (and according to earlier posts) to include a code fix (?)
that prevents any enabling of cellular
receive. (using the method of downloading and pulling the plug)

I was just wondering if, say, someone had a pre-bugfix FT-50R and that they
had performed the MARS/CAP
mod as well as enabling the cellular receive capability. Would this
"software load" work on my new xcvr?
Anybody tried this?

Just for the fun of it, if you have an older FT-50 without the factory
'fix' and have performed the above mods,
and.... have saved an .rdf file with the cellular receive enabled, e:mail
it to me and I'll try it out.

As always, any other information would be GREATLY appreciated...

BTW, miraculously, I now have a Kenwood TH-77A for sale! (hi hi)

Either of the e:mail addresses below work...

Tnx in advance,
.paul.

I am attempting to repair a friends Fairbanks-Morse console
that uses the Fairbanks-Morse number 9A chassis.
I am in need of a schematic. Anyone have a Ryders or Sams
for this rig?
It has a very nice main dial sort of like a large rotary telephone
dial. Another interesting thing about it is that on Jan 3rd 1942
the FBI came to the house of the German immigrant owners and disabled
the shortwave capability of the radio. They wrote the date on the rear
of the chassis and it's still there. I wonder what they did to it?
Any help or advise will be greatly appreciated.

Radiokit in NH 603-635-2235 or FAX 603-635-2943 carries their own brand of standard (not graphite) 3-500Z's with a 1 year warranty. They are very rugged and are popular with the contesters. $200 a matched pair.
Graphite plate tubes can exhibit a short life from out gassing graphite poisioning in amps with inadequate airflow. Amperex tubes have a bit higher gain than Eimac and can cause parasitic problems in marginally stable amps.

> HB9CPW Marc

I agree! This thing is advertised as the "the Finest 3KW tuner that
money can buy." and "The last tuner you will buy."
My opinion is that it is the worst tuner that I have ever bought.
When mine was delivered the first thing that I did was turn the inductor
knob. Guess what? it was at the end of the coil and went right off the
end with very little effort. So before I evan had a chance to use it I
had the cover off to put the roller back on. It has happened several
times since then. I finally got smart. I used a hot glue gun to put a
tab at each end or the coil as a stop.
You have to either nail the thing to the desk or use two hands to turn
the inductor in mine. One hand to hold onto the tuner and the other to
trun the knob.
The turns counter did not work either. Luckily I purchased it from a
good dealer (Burghardt Amateur Supply) and they sent me a new counter.
This is definetly not the "the Finest 3KW tuner that money can buy."

My advise is to save the $300.00 to buy a good antenna and you won't
need the tuner. Or, spend a little more and get a real antenna tuner.

>covered the aviation, vhf and uhf frequencies.

Turn off the radio

Press and hold the B+# buttons while turning on the radio, and continue to
hold
these buttons for 5 seconds after power up.

Now look in the set mode for a new function labled 1 PLACE

Turn both main tuning knobs until you see 100 PLACE in the display.

You have now enabled wide receive with aircraft coverage and 6 digit direct
frequency entry.

>to back it up.

The "common wisdom" in the commercial world is that spectrum is worth
about 1 billion per megahertz as a capital asset. That may be optimistic
in some cases, but lets work some numbers. A commercial two-way channel
can bring in rental income in excess of $1000 a month, or $12,000 a year.
50 such channels can be fitted in a megahertz using today's NBFM technology.
So a megahertz brings in about $600,000 a year. Prorated over a 20 year
capital asset cycle, that's $12,000,000 for one local coverage area of
about 314 square miles. If we take that to represent one US MSA (Metropolitan
Statistical Area), then the top 100 MSAs in the US would bring in over
$1.2 billion over the prorated life of the asset. So a company which could
control 1 megahertz of spectrum nationwide would consider it a billion
dollar asset. Multiply that by the 34 MHz amateurs have at 2m and 70cm,
and you're looking at an asset worth $35.2 billion to a company which
controlled it.

Of course some uses could bring in much more per megahertz than the
two way industry does. For example, cellular phone reuses the frequencies
much more intensely. And other methods, such as SS, can also get substantially
more use out of a megahertz than plain old NBFM. Even paging services use
their spectrum more intensely, so this is likely a lower bound to the
value of a megahertz of spectrum.

> Are there people and organizations out there that would like to grab
>up our spectrum for their own use? You bet there are. But if it were
>really worth "tens of billions of dollars" we'd have lost that fight
>long, long ago.

No, because long long ago there wasn't enough *demand* for wireless services to consume all the available spectrum. Today there is. Advances in technology, and our increasingly mobile society, have caused an explosion of demand for wireless services that didn't even exist 20, or even 10, years ago. Vehicle tracking systems, both for shippers and for consumers, IE LowJack, didn't exist 20 years ago. Today they are big business, and getting bigger. Wireless meter reading didn't exist 20 years ago, today it is big business, and growing. There appears to be an ever expanding desire for paging services, including nationwide paging, today. 20 years ago only doctors and plumbers wanted pagers. And of course there is the wireless internet. The internet itself didn't exist 20 years ago. Today we have services like Ricochet delivering the net to our laptops. All of these uses, and many more, want more spectrum to service their growing customer bases.

> Our tiny chunk of spectrum at 2m and 70cm is barely usable by modern
>data communications standards. Any organization that can afford to
>get its own LEO bird on-orbit can easily afford SHF gear to
>communicate with it much more reliably than with VHF/UHF links. I
>think our claims to bandwidth at 2 GHz and above are far more at risk
>from these sorts of operators.

There will be pressures above 2 GHz, but for vehicle tracking from orbit, nationwide paging services, and low rate data services such as meter reading and Email delivery, our 2m and 70cm spectrum is nearly ideal. That's because the cost of customer equipment is low, so many many customers will sign up, and because directional antennas at the customer location are not needed, IE ideal for mobile users. High rate and bulk data delivery, such as DSS and other point to point services, and point-multipoint broadcast services, will likely be above 2 GHz, but there are plenty of low rate uses which are also lucrative and ideally suited for our spectrum.

Teledesic is not a threat to our VHF spectrum. They have their own microwave spectrum already assigned for their high rate service. If they grow as much as they hope, however, they may pose a threat to our above 2 GHz spectrum in years to come. The immediate threat to our 2m and 70cm spectrum comes from outfits like Orbcomm who are already using VHF for low rate LEO supplied services, and who need more spectrum to expand those services.

Note, the little LEOs are not without competition in wide area low rate data services. Globe Wireless is installing a global network for vehicle tracking and Email delivery *on HF*. This service is cost competitive because it doesn't require costly satellites or costly satellite launches. It probably has less potential for growth than the little LEOs, but then there is less HF spectrum to grow

in as well. So we may see pressure on HF resources in the future from operations like this which have to have lots of frequencies so they can follow the MUF. And then there is the spectre of compatible digital AM which may be an attractive alternative for SW broadcasters instead of moving to satellite DAB. That too could put more pressure on HF frequencies in the future.

None of our spectrum should be assumed to be safe. There are companies out there with viable business plans looking at all of it. Improvements in technology have made this possible, and growth in demand for wireless services has made it potentially very profitable.

FCC Commissioner Ness has said that the FCC will no longer tolerate spectrum warehousing, and Congress passed a law requiring the FCC to give preference to new technologies and new uses of spectrum. We are entering a time of great changes, and every Hertz of spectrum we now hold will come under scrutiny to see if we are putting it to its best use. If we aren't, the FCC is mandated to assign it to those who will.

:>
:

David,

Check QST Jan 1997 for a complete review of the 570d.
The 570d sells for about $800 less than the IC-756.
The IC-756 is more directly compared to the Kenwood 570s,
as the S model has 6mtrs. There is no price at HRO for the
570s yet, and the 756 is still awaiting FCC approval, so,
the prices are still a little grey... I have played with
the 570d for a couple of hours thanks to the HRO folks in
Denver, and it is an excellent radio. The DSP is a true
wonder to use, but, I do like the display on the 756. I
am waiting until I can get a price on the 570s and to play
with the 756... If it hist $2300 I will probably opt for a
ten-tec omni and an external DSP box... Just my opinion, but,
noone has EVER given me the level of service I have had
in the past from the folks at Ten-Tec... Check out the

>The big problem for you is impedance matching

The good news is that for monoband use, impedance matching is not a problem. Provided that the impedance is anywhere near reasonable, you can design a fixed stub tuner in coax cable to match the load to 50 ohms within a single VHF/UHF amateur band. It doesn't even have to be a 50 ohm resistor - which might also bring the price down.

I use a commercial 50 ohm 1kW HF dummy load. On its own, it's OK up to 30MHz, or 50MHz at a push, but it's poor at 144MHz and hopeless at 432. With add-on matching networks it's fine on 144 and 432 as well.

Before you can start to design the matching networks, you do need an accurate impedance measurement (resistance and reactance separately) on each VHF/UHF band. A friend with access to a vector network analyser can usually oblige. Once you know the impedance to be matched, it's a classic Smith-chart problem to determine the lenths of the series and parallel coaxial stubs. If you're patient and really know your way around a Smith chart, you could probably do the whole thing by cut-and-try in RG-58, before stepping up to larger coax such as LDF2 and LDF4.

Apart from extra PK screws in the box to avoid RF leakage at the hoigher frequencies, the only major modifications to the existing dummy load were to make conical transitions out of copper foil to contact the whole silvered band around each end of the resistor. These are not for impedance matching, but to avoid hot-spots. Hot-spots are the main limitation on power dissipation at VHF and above, which is not surprising because the resistor is a significant fraction of a wavelength long.

Hi John. I have a TS850 and have to agree with you. I played with both rigs , read the reviews and bought a TS850. I am very happy with it. It has a lot going for it. It has a speech processor that really works! According to QST and the ARRL labs (not a pair of ears), the TS850 has a receiver on par with the FT1000. They were the only two rigs that could not actually have their blocking dynamic range accurately measured because the test signal required to cause blocking exceeded receiver safe - handling limits! On many rigs, including the 990, internally generated noise limits the blocking dynamic range measurement. The 990 is a very nice rig also and most hams could be happy with either one. I just think that it it is important to point out that some of these "older technology" rigs are still very fine pieces of equipment and may be a better performing rig than some of the lower priced DSP rigs - in my opinion. I plan to probably seriously consider one of the new high end dsp rigs this year, but plan to keep my trusty TS850. It is too good of a rig to let go for $1200 os so. ---- Steve N9ROU

Too bad you feel that way Tom. Let me just give you a little of what I think about your general statement about no-codes being assholes. My wife is a no-code. She is the kindest gentlest individual you would ever want to meet. She is also a VP of a major bank. She raises 2 children and takes care of a household with nary a complaint and she is VERY good at all she does. She is an excellent mother, wife and business woman. I'm sure she'll be glad to know you think she's an asshole just 'cause she's a no-code.

There are father out there who's children have taken the no-code test. These children apparently range from reading age to 18 years old. Not only do the children have pride in themselves, but the fathers (or parents) beam of these accomplishments. What father couldn't well up with pride seeing his child gain a no-code license. But of course, according to you, they are assholes.

Very nice. your attitude about no-codes has certainly shown a degree of class most of us don't aspire to. Your statement shows you as a boar. In a hobby purported to be a gentleman's hobby, your comments about what no-codes are, and the fact that they certainly can't have the intelligence to make a meaningful comment about a radio or manufacturer just shows that class doesn't follow the license.

To all of you who were not a part of this discussion and DO show a higher level of class, I am sorry I had to write this. It is certainly not directed at you.

Tom, since you are so fond of it, you may have the last word.

If the scratches are deep, you're hosed, it'll need replating. But
if they're just the usual surface scratches, buff them out with auto
chrome polish.

1001. KENWOOD TS-570S INFO !

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-12 00:00:00 UTC
From: hershman <hershman@ix.netcom.com>
Message-ID: <32D95B55.261E@ix.netcom.com>
Source record: 186420

Kenwod says that the TS-570D is replacing the TS-450. They say the
TS-570s (6 mtr included) is replacing the TS-690. Funny, It appears
they raised the price $250 on each for its price class. I saw on a
Canadian Dealer Web Page that the new Kenwood TS-570D costs just a bit
more than the Icom 706. If the Icom 706 costs about $1200 then the
Kenwood TS-570D should cost around $1300 NOT $1550. I guess Kenwood is
trying to get as much as they can at first and then drop the price once
the demand in the USA drops off! The Kenwood TS-870 costs about $2650
when it was introduced 6 months ago and now costs $2200.
My advice to all hams considering the Kenwood TS-570 D or S models :
" Wait 6 months and save two hundred dollars! "

Message-ID: <32d95f3a.20027455@news.flash.net>
Source record: 186424

I did a bit of research on this, locating the text of the article from
"USA Today". Then, using the keyword "Teledesic", I used the FCC's
search for anything with that name. In brief, here is what I found:

Teledesic proposes to launch 840 satellites in 21 low orbit planes
(about 460 miles). The have petitioned for the frequencies of 28.6 -
29.1 Ghz (uplink) and 18.8 - 19.3 Ghz (downlink).

I could not find a reference to the 2M or 70 cm band.

The UT-15 is an interface board only. It is designed to connect a
Communications Specialists TS-32 encoder/decoder module inside an IC-271/471.
If you run across a UT-15S, however, that comes with the TS-32 already
installed.

Interested in Amateur Radio?

The Penn Wireless Association (PWA W3SK) will be conducting its annual "School" starting February 6 through May, 1997 at the Bucks County Community College.

Classes are held every Thursday Night from 7:30 PM til 10 PM
A textbook, "Now You're Talking" is available from ARRL, Radio Shack, or PWA ($29.95)

This course is designed to teach the basics of Morse Code (5wpm), the regulations, and the minimum electronic theory to license as a Novice, Technician, or Technician Plus amateur Radio Operator with the FCC.

The classes will be coordinated and taught by Paul Hoffmaster (N3JJZ) who can be contacted at 215-547-6346 for reservations and information.

73 (Best Regards)

Rather than getting into the rig, and hopefully you bought it recently
new, why not send/take it back to RS. I would think that something new
with an anomaly such as this is really not acceptable and should be
fixed, replaced or refunded. There are plenty of good 2M rigs out
there with competitive prices.

Body handling: Binary attachment payload not displayed: ft101.jpg

For sale: (Based in the Northampton area, UK)

A Yaesu FT101 transceiver with matching (external) second VFO unit,
original packaging, manual, microphone and power lead.
Also has 600Hz crystal CW filter, G3LLL balanced mixer upgrade,
30m and 11m bands (10MHz and 27MHz)

£255

Also comes with a spare set of PA valves worth £50
(Although it's still delivering full power on the ORIGINAL set.)

Suitable as a collector's item or a cheap introduction to HF CW & SSB.
Built to last, it will still easily cope with hard every-day use.

Transceiver is in very good condition - viewing is not a problem - just
drop me an email

tim@spaz.demon.co.uk

[One or more binary attachments are retained only in the source text.]

Source record: 186195

MFJ equipment... I have mixed emotions, and here's why:

With only one exception (an MFJ-249 VSWR analyzer), EVERY piece of MFJ equipment I've ever bought new had something wrong with it, ranging from loose and missing hardware, to broken wires and solder joints, to mis-wires that caused things to smoke 'n spark! Once I corrected the errors, however, in every case, I found that the equipment worked well and I had no further problems. I've bought a number of used MFJ items that have also served me well (the previous owners must have taken care of the problems). I don't hesitate to buy an MFJ item, but I go into the purchase expecting to have to repair it before I can use it.

I met Martin F. Jue, the owner/founder of MFJ, at a hamfest a couple of years ago. He's a very quiet, personable man who is genuinely interested in what we hams think of his company's products. I spoke with him about the quality problems, which he admitted to having, but he stated that they are working hard to "clean up their act" and weed out the QC problems. From what I hear, I think they're on their way to doing it.

Need some help here. I am an Englishman and have the job of helping to sort out the estate of a friend of mine who has recently died. He lived CA/NV border.
He had and I quote his wife " a room full of ham radio gear". Knowing him, it could be junk or, more probably, state of the art.
Although I have no problems with the rest of his stuff -- I'm an antique dealer -- I have no clues as to value or how to sell of the radio equipment.
Any of you guys want to get involved here. I'm not wishing to rip the last cent out of someone for the gear, just to get a fair price for his widow.

Please e-mail me at graham@ismacs.u-net-com or graham@ismacs.net.

I will be in the States sorting this out for five days from Jan 22.

TIA

GF

But I already have Netel at 9.9 cents per minute, no minimum
usage, free calling card with no access fee (higher rate), free
800 or 888 number, $100 cash paid upon signing up (toward the
multilevel commissions). I get a paltry few dollars of payback,
because I don't market the program. Station calls to Great
Brittain are 35 cents per minute.

Source record: 186204

Bill, welcome to the world of GE radios. Your first mistake was not buying a low-band MSY. The squelch circuit in the MastrII is kind of flaky. Just keep it in channel guard (we Motorola fans take offense of the use of Moto terms with GE radios) and don't worry, be happy. Carrier squelch repeaters went out with the 60's.

Then stop cross-posting yourself. After all, what's so fucking
interesting about scanning in the UK, anyway? I mean, when you limies
overhear bonnie Prince Charlie saying, "oooh Squidgie, I'd love to be
your underwear," it makes headlines in your newspapers (we call them
tabloids) for weeks on end. You brits need to (1) get a life, and (2)
realize that the British Empire is, and has been, dead and buried for a
long time, not necessarily in that order. You people are becoming as
pretentious as the French... (ouch!)

Was there anything in the article that said what cellular system he was
using? I cannot believe that a top American politician is still using an
analogue cellphone. If he was using analogue, the twit deserves all he gets.

If it was a digital system, it means the American police have routine access
to digital cellphone decryption equipment.

>
> BET OF LUCK N1RKTGive me your snail- mail address and I will send out our amateur
brochure describing our line of intermod filters. These are patented
asymmetrical notch filters that are about the size of a cigarette pack:
1. They do not require any operating voltage.
2. If your rig is dual band you can leave it in line as it is
transparent at 70cM
3. The filter has a nominal 0.5 dB loss in 2M
4. Because it is a notch, it allows reception of most VHF freqs except
151-153 MHz.

Uhhhhh Roland:

Not that I support those tax collecting morons, but your reference to
the Gestapo rolls off your lips far too easily. Gestapo tactics would
more likely follow the line of:
1. Inspection of all vehicle and occupants returning into the state's
border.
2. Separation of vehicle occupants for individual interrogation and
cross-correlation of statements.
3. Various combinations of leading accusations and mental / physical
abuse.
4. The creation of detailed records from above interrogations, copies of
which would be sent to your local Gestapo office for use in periodic tax
investigations.
5. An occasional summary execution to show they mean business.

My point is that your comparison is in error by more than a few orders
of moral magnitude. Although a Libertarian would say that they are both
on the same slippery slope, state sales tax collection is a long way
from the Gestapo.

And pardon my short rag-chew!

Ed

I think it was made only for a very short time around 1979 or 1980. It was a full-featured rig, that I believe had a solid state transmitter, which was unusaul because Kenwood was pumping out tube-final rigs well into the 80's. Digital readout, all black with plenty of knobs and buttons to look neat. I don't know why they didn't continue down that road...maybe they had design probs.

> to expand those services.

The original context where I saw the threat to 2m/70cm actually
came from a Motorola ad for their "Iridium" system in Aviation Week
about 3-4 years back; the fine print noted that their LEO up/downlink
frequency plans included 146-148 MHz...at which point I nearly had
a stroke!

ObLightheartedness: Since Iridium has been redesigned to use
a constellation of 66 satellites rather than 77, shouldn't it be
renamed "Dysprosium?"

> None of our spectrum should be assumed to be safe. There are
> companies out there with viable business plans looking at all

> growth in demand for wireless services has made it potentially
> very profitable.

I think this is absolutely correct. If we can't demonstrate that
amateur radio is a service, not just a hobby, the new policies
regarding spectrum usage will likely flush us right down the
bowl.

Message-ID: <01bc00f2$ae4b7e40$fd1479a8@wave.mindspring.com>
Source record: 186252

Here is the mod. I performed it on a radio I bought yesterday and it opened
it all
the way.

73's
YAESU FT-50R Expanded Transmit 120-230, 315-505 MHz
[FREEBAND MODIFICATION]

1. Remove battery
2. Remove the Ni-Cd sticker
3. Slowly lift off the keypad and carefully locate the jumper pads
4. Locate and unsolder jumper number "1" (see picture below) it is a solder

blob
between 2 pads.
5. Locate and unsolder surface mount resistor "A" (see picture below) be
carefull!
It is the first resistor on the from left
6. Reinstall the keypad with the two screws
7. Turn radio off
8. Press down and hold the tuning knob and lamp button while turning on the
radio.
VIEW: looking down with keypad removed

```
*** ***
= ***** * ***
I ******************
* --------------- *
I* | [FREEBANDER] | *
I* | _____________ | *
* YAESU *
I* =============== *
I* =============== *
* =============== *
* ========== *
* *
* --------------- *
* | ABCDE | *
* | IIIII | *
* | : : : | *
* | 1 2 3 | *
* --------------- *
******************
```

10. The vfo should display 144.000 Press FW. (this step may not be needed
but
it worked for me)

Power off.
11. Powerup with lamp/ptt/knob held down. It should now be in tune mode
with
something new
(BAND= A 1) change it pressing the knob for 1/2 second and then turn
the
knob to FREE.
(BAND=FREE)
12. Power off and back on NOW RADIO DISPLAYS 50~540 590~1000 no gaps!!!
(Dont change any other function or you could screw up alot of
adjustments
here)
IT will tx where ever it locks. One radio 122~231 and 309~502 and
another
radio was
120-232mhz and 315-509mhz. This varies radio by radio.
Tx is only miliwatts near the edges (DONT TX OUT OF BAND!!!).
Rx locks after about 74mhz. it is very def in the 220 band tx is
miliwatts.
no tx above 502
but varies radio by radio.

13. If you have the ADMS 1 software you should have a copy of what was in
your
radio.before you
started.
14. Copy from the radio. Save and name this file FREEBAND. This is to be
saved
as a clean copy for
future use.
15. Copy from the radio again (or just copy the file) name this file MERGE.
16. Merge the old file to this file and send to radio.
17. With your palms facing forward put your thumbs in your ears, wiggle
your
fingers and stick
out your tongue at your Users manual while it is open to page 10.
18. Then update page 10.

Dont make the FCC and Yaesu angry at you by trasmitting where you are not
supposed to.

This information came from a Newsgroup message by Alan Judd, information
gained
from the Web Page at
http://members.gnn.com/hca/ft50/index.htm and my own attempts at restoring
the
radio using this
FREEBAND Mod.
Please give Alan Judd great thanks for subjecting his radio to T&E R&D
(trial
and error research and

development).

1066. ICOM W32A MODS

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-13 00:00:00 UTC
From: 1 <ACABAMS@WORLDNET.ATT.NET>
Message-ID: <01bc00f3$8dd487a0$5b7074cf@default>
Source record: 186253

Can the radio receive 470.600?
Any mods available?
PLEASE EMAIL ME OR POST HERE.

1067. Re: Wanted: Info on Yaesu MD1B and MD1C Mics

>input appreciated. 73 Barry

The older 1B model is switchable from low to high impedence input.
Since Yaesu has stopped producing rigs with high impedence audio input
and now the 1B has been replaced with the 1C. Hope this helps.

Jerry

1068. Re: Yaesu vs. Icom / Dual Band HT's

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-13 00:00:00 UTC
From: Trent Helms <thelms@orl.mindspring.com>
Message-ID: <01bc00fd$bf386000$fcaf79a8@earth>
Source record: 186255

Mark,

Do you know off hand whether or not the ICOM Z1A will do wide-band Xmit? I
am student pilot and I have found out how to receive wideband but don't
know it is possible to modify to xmit.

Thanks for any advice in advance.

Trent Helms, KE4FU

I have the Yaesu FT530.. .. it does TX from 110 to 180 and 400 to 470
and of course has AM rx. Just open it up and cut the green wire
and do a CPU reset. I have used it many times for X-band repeat
and it does a great job. I love the way all of the functions
on the 530 work and I don't think there's a thing about it that
I would change.

1069. FT1000mp menu 1-7

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-13 00:00:00 UTC
From: w_hutch@accessnv.com
Message-ID: <5bc8sf$672@nw101.infi.net>
Source record: 186256

Does anyone know what menu 1-7 does? The entry reads AutoFast and my default setting is Off. However there is nothing in the manual about this menu entry, and Yaesu won't tell me anything about it. I wasn't even aware of it until another ham asked me about it during a QSO.

Thanks de:
Bill KI7BE

Why dignify this obvious douche-bag with a response? By the way--it's boor, not boar, but he may also be that as well. He may even wear woman's panties, for all I know.

Congratulations on having a talented (and licensed) wife. My wife is talented, too, but happens to think that all radio activity is "static" and complains about it from 50 feet away. I happen to like even static, actually.

Happy New Year. We needed a new flame-war.

I bought a HTX-242 recently. Has anyone else noticed
a carrier like signal on any of the frequencies programmed
into memory? On 146.76 I have a constant S-1/2 signal,
no intelligence, no flucutation, apparently generated
from within the HTX-242.

Comments and/or fixes ??

After months of development we are proud to announce the release of Memory Master v1.0a. Memory Master software completely programs all the standard memory channels from your edited computer file in only 2 minutes. The colorful edit screen is extremely easy to use and instantly indicates changes as they are made to the frequency file. No more pushing small buttons or trying to remember how to program the memories. Frequencies, mode, and repeater splits are easily saved to a computer file and programmed in a matter of minutes. Memory Master is extremely user friendly and is a value at only $34.95. A Icom Ct-17 or compatible computer interface is required. The complete package software plus interface is $134.95. To order send check or money order to:

I have had an MFJ 989C since mid-93. When it arrived, something was rattling around loose in it. The roller inductor was not even bolted to the chassis!! The variable capacitor shafts were not aligned with the holes in the front panel and they would bind and not turn completely. Two of the contacts on the antenna switch had never seen a drop of solder.

I put it all back together and have run as much as 750 watts through it with no problems. Of course, I am not using it to match anything exotic, like a chain-link fence. I use a 135-foot long dipole at 70 feet fed with 450-ohm open-wire line, about 90 feet long, that wanders around through the wall, over the roof, etc., and have had no problem. The turns counter has a little backlash.

If I had it to do over again, I would:

1. Find an old Johnson Matchbox. They came in two versions: 275-watt and 1-kw. Probably the best tuner made. You can find them on the used market but good, clean ones with manuals and fwd-ref power coupler are not cheap.

2. Build my own. Use circuits from Handbook or Antenna Book and buy parts from ads in QST, 73, or CQ, or at Hamfest.
3. Buy the big Vectronics tuner from Turner Electronics. I have seen one and they are well-built. Have heard good things about them, too.

1079. my 6mtr rptr squelch opens at night -WHY??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-13 00:00:00 UTC
From: ka2qep@webspan.net
Message-ID: <5bckou$62q@news.webspan.net>
Source record: 186266

Hello, my 6 mtr repeater squelch opens at night as though there was a rf noise floor rising, or signals getting into the input only at night. I thought the cold temperatures were effecting the squelch circuit because it has been around 15 degrees F, and when it was warmer in the fall there was no problem. So I tightened up the squelch a little. I still have the problem because the machine times out and I can't access my machine from 40 miles away like before! I have a mosfet preamp on the receive, which is not too radical. I would expect problems if I had a gasfet preamp on the receive. Also I have a four cavity duplexer in the system, which would act as a filter from out of band signals. I am using a GE MSTRII. I have to keep it in PL for now. If anyone can suggest some ideas, I would really appreciate it.

"MFJ" and "quality" are mutually exclusive terms.

1. I bought MFJ 989C tuner and had to rebuild it to get it to work.

2. Bought their cable to cable up my packet to Yaesu 2-meter rig. Had
to solder three connnections to make it work.

3. Bought their simple little HF antenna analyzer, MFJ 207 and it's the
handiest thing in my shack.

Go figure.

I have for sale a SASI Satracker Rotor controller.

Unit is designed for satellite use, but could also be used for terrestial work.

Controls both EL and AZ with the Yaesu GB5400, Kenpro 5400 series rotors, maybe others.

Comes with tracking software, manuals, connecting cables and all paperwork.

Unit works great with major satellite tracking programs.

Uses parallel port so serial ports are left free! Great for laptop or field day use.

In perfect condition, both cosmetic and electrical.

Cost almost $300 new, I am asking $150 or best offer.

Respond to mail kg2ic@amsat.org or call (716) 689-6727 evenings.

>in europe it is from 430 - 440.
>most countries have a shift of -7.6 meg.
>some have +1.6 meg.

Our whole allocation in the US is from 430 to 450 MHz. The repeater
sub-band is from 440 to 450 MHz. 420 to 430 is mostly used for ATV.
430 to 440 is used for ATV and weak signal and packet. Few repeaters
are in that sub band.

>from within the HTX-242.

146.76 MHz is a harmonic of TV colorburst frequency, IE 3.579... MHz.
Since TV colorburst crystals are so universal, and thus so cheap, they
are used as references for lots of things, notably Touchtone pads, and
commodity single chip microprocessors. Likely this is the source of
your phantom signal.

Getting rid of it may be a challenge, but it is easy to move off of
76. Just put a gimmick capacitor across the crystal and twist until
the phantom moves far enough off channel to no longer be a nuisance.

If you aren't familiar with gimmick capacitors, they are made with
two pieces of insulated wire. Just solder one wire to each lead of
the crystal, then twist the wires together to increase capacitance
and shift the crystal operating frequency. Since 146.76 MHz is the
41st harmonic of 3.579... MHz, you won't have to move it far, and
the circuit in which it is used won't be adversely affected.

Wires from 1 to 2 inches in length should do. Cut off the excess
wire tails after you've moved the frequency far enough, and tape up
the gimmick so it won't untwist. Works fine, costs nothing. I use
this method to move the microprocessor harmonic of TNC2s and their
clones off of 145.01 MHz.

I normally use enamel insulated wire, but regular thermoplastic
insulated wire will work too, it just takes more twists to get
the same capacitance.

The quality of the many MFJ products I have bought has been poor. However you get what you pay for and they are usually priced much lower than competitors.

That said.....I have found that all the stuff works as advertised and the effort to bring the quality up for reliability is easy for a ham. It usually involves things like replacing rivits and beefing up wires, solder connections and mechanical bracing ect. For example I use a little mobile tuner and after I did the above it has been banging around my car for several years and keeps on ticking.

So if you don't mine doing a little work, which can be the fun part of hamming, then go get em.... 73 CW OP

1096. Help w/ Kenwood TR-9130 2mtr a/mode

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-13 00:00:00 UTC
From: n7ory*@*primenet.com
Message-ID: <32da652c.7990867@news.primenet.com>
Source record: 186283

A friend of mine got a "good deal" at a local ham fest this last weekend. A Kenwood TR-9130 2mtr allmode mobile rig. It looks brand new. When talking to the guy who was selling the unit, the seller says "works good on FM, never used it on SSB...."

Well, long story short, SSB doesn't work very well. The output is very low at first, but with continued use, the output steadily increases to about 15-20 Watts. Seems like it needs to warm up, but it's solid state. Also, on FM, the power output should be 25W high and 5W low. Using the power setting switch has no effect on output levels. FM remains a solid 25W.

One other problem, although minor in comparison.. The rig was WAY off frequency when I looked at it for him. I had to tune 4.8 KHz up to hear a QSO on 144.2. The RIT was even farther off! I managed to get the rig on freq by adjusting a trimmer cap and a small pot on what I beleive to be the PLL board. The RIT was adjusted into place by another pot just a bit farther back.. BUT... Heres where the weird part comes in...

When you tune below 144.200 it seems to jump freqs a bit. If you tune down to 144.198 or there abouts (don't remember off hand) the rig receives the signals present on 144.200!

If anyone has any sugguestions I'm sure he would love to hear them. I have done what I can. Please E-mail me with any info you might have, I'm not in these groups as much as I used to be. Thanks

1097. 6 meters on new HF rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-13 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <853176891.7886@dejanews.com>
Source record: 186284

And now, the current "What's the deal?!" piece from KA4RQB.

What's the deal with all the recent hype on including 6 meters on all the new HF rigs to come out lately?

By the looks of the new equipment coming out, you'd think 6 meters was the next greatest thing to 2 meters. Lessee here ... IC-756: 6 meters. TS-570S (not "D"): 6 meters. IC-706: 6 meters. Yaesu FT-whatever (just announced): 6 meters. *Why?*

Now, don't get me wrong. I know we as hams have a responsibility to use what we've got, or we could well lose it. I have nothing against 6 meters; it's a wacky band that can surprise the heck out of you when the sunspot cycle's high (and when it's not, thanks to sporadic E, etc.). But why is it so popular on the current crop of HF rigs? After all, it's a VHF band!

I'm in the market for a new HF rig in the mid-$1500s, and it looks like I'll be purchasing a TS-570*D* next week. $2,000 bucks or more is just a little too pricey for me. I'd like to have other rigs to compare, but the current ICOM and Yaesu offerings are $500 to $800 more expensive than the 570D. Why must they include 6 meters, which obviously drives up the selling price? (Witness the IC-736, TS-690S, etc.) Why not come out with an IC-756A (or whatever) for those of us who'd rather not have the 6-meter option?

I live in Central Virginia and 6 meters is not that active here. You might say, "Yeah, because no good 6 meter equipment has been available, until now!" Not! The acclaimed IC-736, a very popular rig, has had 6 meters on it for half a decade. So has the TS-690S (also been out 5 years or more), IC-706 (now more than a year on the market) and other rigs. Any increase in 6 meter activity? I haven't seen any around here!

There are plenty of 6-meter-only rigs out there, and quite a few HF+6 as well. I don't want or need 6 meters on my HF rig. As far as I'm concerned, and I'd suspect a few other hams as well, leave it off! Or at least offer a model that omits the 6-meter band so we who are on a budget can afford it! How *dare* all these manufacturers say their $2,000-plus rigs are *AFFORDABLE*!

And that, my friends, is my two cents' worth. You may have it for free. 73!

1103. TS820 with burned resistor

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-14 00:00:00 UTC
From: dmatt@roch875.mc.xerox.com
Message-ID: <5bemi2$304@node2.frontiernet.net>
Source record: 186090

I recently purchased a TS820. The rig had passed through
two hams (tech) who had not upgraded and the transmitter
had not been used except for a quick checkout by another
ham a few months ago. The rig had been used for recieve
and possible for code practice with the heaters turned
off (ouch).

There is no rf out on the Plate and Load tuning step
of the transmitter setup. I opened it up and found that
R7 on the rectifier board was burned. This resistor
appears to have been changed sometime in the past as
the current one is elevated on one end. The schematic
lists this line as -C coming out of the rectifier board.
It is fed by the 90v tap of the transformer.

What other parts are likely to be gone? Is this a common
failure mode? If it is a commonly blown $.39 part I am
not going to worry about going back to the seller. If it
is $100 worth of blown semiconductors it is a different
story.

Any guidance from other TS820 owners would be appreciated.
This is my first hf rig. I do have a reasonable background
in tube and transistor troubleshooting and can easily replace
the resistor :-).

Also, is there a Kenwood owners listserver?

Ok... If I'm being given the doubtful honor of the last word, Dale...

Lets' make it "LEARN HOW TO READ THESE MESSAGES PROPERLY".....

IN ENGLISH: If you keep track of the """>"" signs or arrows if you would
you will see that in a multiple dissertation, who said what...[?}

In other words your trying to give me credit for the no-code assholes'
comment... But in reality it came from: Robert Fowle - KC8WDC supposidly!
the actual comment was unsigned but the header came from a person with
a 666earthnet@inexco type address [followed his header address to several
messages of his, one by name hence Robert Fowle an the other with the
KC8WDC call which is not valid according to the UF callbook server...

So who is this clown; your guess is as good as mine...?????????????
Not that I really care.

If you would have kept track of things better, you would have known this!
Also another clue about the presents of another party in the message was:
my referral to being a clone asshole of Roberts'... [look back its even
in this message, at least an out take is...]

Either your new at these type of messages or your not used to the >>>'s
placed in the message by "Pine" the local mail handler for the Univerisity.
They are not put in by me, they are done automatically by "Pine" in a
reply, period...

COUNT THE DAMN ARROWS [you missed by one, it wasn't me]...

Its nice your wife has her ticket, so does mine... She is also the
General Manager for 7 clinics in Florida run by a group of Doctors
who formed a corperation for Health Care Management... Three weeks after
getting her ticket, she had decided to remove her TM-942, an mount her
a Cell phone in the car permanently. To her it was like listenning to
CB on 2 & 440... [She gets more use out of the phone] She won't even
listen to HF, to many drunks an jerks for her... After listenning to
16 years of mens egos' in the medical field, she has no time for their
crap on the radio... [She makes more money than most of the guys on the
radio...]

All this means exactly nothing.... Other than the fact if your wife read
the message, she could have explaned it to you. People are getting a real
kick out of this message thread... Expressions like "Fun To Watch", or
do any of these people know how to read [???] are being used to describe
this mess...

Now we have Roger, who jumps in and doesn't bother to read either, but is
a spelling critic... He just blindly follows your lead... Now he rambles
on...

I don't think the problem has a damn thing to do with no-code, just peoples
ability to read and understand who said what??? People are so damn
concerened with no code, but not in getting the story correct...

NOW GO BACK AN REREAD EVERYTHING... Go and piss an moan to Robert, or
KC8WDC or 666earthnet.??? or whatever this person wants to call themself;
that is if he hasn't fell out of his chair, reading this crap in laughter!

He is probably getting a bigger kick out of this than me.... ALSO:
When in doubt, make it a personal reply, to make sure you have your facts right, before going off half-cocked!

This still doesn't answer the original an only comments made by me.

"WHAT is GOING ON WITH YAESU & THE FT-990??? We know its being dropped but why???"

My second an third repiles are unchanged, because people jump to an idea an have their facts wrong..

The rudeness an crudeness of my answers come from my dislike of dealing with idiot comments that DO NOT APPLY... I enjoy letting people hang themselves with their own stupidity, an go out of my way to wind them up....

ALSO: For Roger - Read these damn messages yourself, before getting into something with too little knowledge... Its Ok to follow the leader of the band, just be sure to know the music... You can look real stuipd real easy without trying to...

If I can't do anything else; I'll get the continuing Education Dept of the University to:

Get you: The local remedial reading schools in your area an the internet message handling an thread following guide mailed to you...

Enough said??? Or haven't you hung yourselves enough???

FUN TO WATCH

Roger get a LIFE... An stay out of flame-wars, your not bright enough.
Apparently you can't read the thread of who said what any better than
Dale...

LEARN TO COUNT THE ARROW's [> >> >>>], they will tell you who said what.

You too missed by one an due to editing didn't get the full reply of a:
supposed Robert Fowle KC8WDC that started this message thread...

I don't put the arrows [> >> >>>] in, the Pine message system does it
automatically in a message reply... So if you get lost blame them!

[Just to save you time, its [> >> >>>] know as the greater than sign
not really arrows, there was no indian attack...

As the folks here at the University would say: "Your really fun to
watch too..."

Enough said or are you going to read the post to Dale I sent as well,
before going off the deep end an making a bigger fool of yourself???

People should have their facts right, before opening their mouth in
one way shape form or another...?

> All the code-no-code-yes-I-did-no-you-did-not stuff is most interesting,
> but, did anyone ever answer the man's question about the FT-990 PLL??

No.... Not at all.... / Tom

They were all too busy trying to give me credit for the comment that
a "Robert" the smart-ass threw in, to figure who said what...
His was the no-code ass-holes comment...

Dales' was the knowing more than Yaesu comment being part of the Lic.
requirements...

They should have thread reading requirements, instead...

Also if you check the Yaesu www page the Ft-840 & Ft-990 are being
dropped {probably for the same reason as per "Chuck" at Yaesu Serv.}...

Too bad its a nice rig, use it for digital an the Ft-1000MP for voice...

Source record: 186100

Yep.. The TS180S was plagued with design problems. From lousy thermal characteristics (drift as the rig got warmer) to a poor final output stage. I had a TS180S (bought in 1985) that went back and forth from AES Wisconsin about 6 times before I upgraded to a Drake C-Line. It was OK on cw, but did not offer QSK. It lacked the WARC bands (though there was 1 AUX position on the band switch). It had the same basic display as a TS-120S/TS530S (blue tube display). Provision for narrow CW filter too.

It was a top of the line rig in it's day...sold for over $1200 back in 1979. The mobile companion was the infamous TS120S (which was also loads more dependable). Check QST magazine...it was about the time that Icom released their IC-701 transceiver and Yaesu offered the FT-301(D) with the nixie tube readout.

The 180 line included the PS30 power supply, SP30 speaker with filters, VFO 180 matching digital VFO, AT 180 antenna tuner, and the DFC180 digital frequency controller option (which allowed storage of 2 memory frequencies and "dual" vfo operation without using the external VFO). I see the 180's go for between 300 and 400 today, the higher price including the DFC, cw filter, mic, and external speaker.

>73 Tom

I agree with Tom. I just (in November) replaced all of the
electrolytics and bleeder (equalizing) resistors. Four of the
resistors I removed were way off, thus (I think) causing the failure
of 3 of the capacitors. For the capacitors, I used some from Mouser
that fit on the same mounting holes as the pop rivets for the old
caps. The SKU for the caps was 539-CGS450V140 and the brackets
539-VR3. They are quite expensive (around $11 each). Good luck Gary!

1123. TM-733 questions...

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-14 00:00:00 UTC
From: "Phil M." <philma@ix.netcom.com>
Message-ID: <32DBAF88.40AB@ix.netcom.com>
Source record: 186110

I was playing around with the Kenwood TM-733a and found some functions that aren't documented anywhere. Does someone have an idea what these do?

F+SHIFT, and
F+TONE (press and hold F and hit the other key)
Both cause a sound and the small ON and OFF indicators to alternate and the tone of the sound changes accordingly. It's similar to the F+ABC for the ON/OFF of the AIP, but I have no idea what these do.

Any ideas?

Also, why the hell do we have to BUY the PL tone decoder board. That thing runs $50, when my Radio Shack HT came with it built-in (as do many other rigs, I imagine)???

There's so much intermod around here that maxing the squelch sometimes doesn't work, and PL off the repeater helps a lot.

I would like to buy any of the Icom bookshelf portables. Must be clean, unmodified, working, and have manuals. Rigs include:

IC-502A
IC-502
IC-202S
IC-202
IC-215
IC-402

I would also buy any accessories, either with the rigs, or separately, including:

Amplifiers: IC-20L, IC-30L, IC-50L
Power Supplies: IC-3PA, IC-3PS
Mounting brackets

Please e-mail:

1125. Matrix for Handheld Scanners and Features

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-14 00:00:00 UTC
From: Bill Higdon <billhigdon@earthlink.net>
Message-ID: <32DB9E14.2640@earthlink.net>
Source record: 186112

Has anyone put together a matrix of Handheld Scanners and Features?
There is one availible for RS models but, I have not seen one that would
compare different manfactures models.

1126. BAD Noise Blanker on a Alinco DX70 t

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-14 00:00:00 UTC
From: Dave <D.R.ABSHIRE@worldnet.att.net>
Message-ID: <01bc01d2$dc07f440$035292cf@default>
Source record: 186113

Has anyone had any bad experience with the noise blanker on a DX70?
I have a 1991 Chevy truck with a 350 ci and go noise from either the coil or the distrib.
Its not from the Alt, or the fuel pump cause I fixed that. Is there an adjustment for the NB in the radio? I put the NB on and the SSB is so distorted I cant understand what there saying no matter if there close or not. Other than that I like the radio but now I have it on the base and run the Icom 735 in the truck, but its a little big. Any help via either E-mail or here would be great. Alinco E-mailed me back with some cock&bull story about if it had a SN above 1000 there was nothing that could be done at this time, so guess I will have to wait till the SN gets in the 10 thousand range before they can help me. Or buy another Icom and take this one to the Crystal River Florida Ham Fest and paint a big yellow lemon on it.

Thank for any help
Dave

I know nothing of this particular long distance carrier, but I can say
that anyone who does not investigate alternatives to MCI, AT&T and
Sprint are paying too much, particularly if you make any great number
of calls during the day rate period. Flat rate pricing of 9.9 Cents
to 10.9 cents per minute, coupled with 6 second billing increments,
have saved me a small bundle. Most of these companies are resellers,
and their traffic often goes over one of the big three, or the almost
as big fourth major network, WorldCom

Dear Tom,

Never heard of you, never met you, never directed my original (single) post to you, but now seem to be the newest object of your ire.

Unlike yourself, who seems to have a need to lord your allegedly superior thread-reading and intelligence-rating abilities over all who foolishly download your many publicly posted, uninspired and purposeless messages, I've emailed you with my responses rather than bore (another spelling!) the rest of us with them. Except for this one last expression of disgust.

I guess your age at 18. Do you have a ham call? Or just a pc in a room with a phone line?

So far, you're a runaway for Asshole of the Year, 1997.

I didn't provide the URL because I am making a social statement. People are so lacking in initiative that they ask a question like this, and then actually get miffed when you don't spoon-feed them. "Some people....." There a a zillion ways to find a URL and/or a phone number. How about a search engine? How about a magazine ad? How hopping around on various ham-related pages until you find a link to it?

This kind of thing indicates where our society is going. My guess is that you are an underachiever. What do you do for a living?

I have a Yaesu FT990DC for sale. It is in excellent cosmetic and
working condition. It has the optional narrow SSB filter and the
matching SP6 speaker. It also has the MARS and CAP transmit
modifcation done. I unfortunately do not have th e original box it
came in but i do have all the literature. The unit is still a current
model and it sells for $1849, SP6 $159, ssb filter $159.
I am asking $1500 plus shipping. I am firm on this price.
Need the cash for a yaesu ft1000.

Thanks, Jim KA3JSO 215-364-1445

I -- Im looking for one HP front panel logo emblem. Have one you could
> spare????

Is this the one that is 1/2 X 5/16" black on the left and blue on the
right with a silver circle and h/p in black letters. If so I'll put in the
mail to you. It has been in my tool box for over ten years waiting for a
good home.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

>not.

Also, it means that if a no-coder (like me) plans on upgrading soon (like me) they can buy an HF rig and have it be usable under their license while also putting it to use as a HF receiver. Then, when the code test is passed, they grab the key (or the mike) and off they go without having to purchase a separate piece of equipment. From my point of view it's a pretty good idea.

Just $.00002 from one of those dreaded no-coders.

From: Brosh <brosh@matnet.com>
Message-ID: <32DC0B7D.1F07@matnet.com>
Source record: 186157

I have one word of advice-don't buy a 2000H in a high intermod or high VHF exposure area. They are very poor in that respect, mine is virtually useless in certain area of anchorage, it will pick up every pager signal it can get it's hands on.
The actual problem may be less from intermod than image rejection in the IF section, which means that you really wont be able to filter the interference out using a notch filter.
BTW, my 2000H went back to Icom twice under warranty, once for a problem that completely froze the display and operation, after a whole 2 days of use, and once for a lack of RF output. It spent a total of 6 weeks or so in the shop for those 2 repairs, not exactly speedy service. I know 2 other hams who have the same radio, one who pulled his out of the car and replaced it with a yaesy 2400, and another guy who loves his to death and wouldn't part with it, but then again, he rides a Harley so he enjoys pain. I am very disappointed with it, and will have to think long and hard before buying another Icom.
hope this info helps. CUL de Chris WL7PV

My MFJ 249 antenna analyzer has worked excellently from day 1 and does
everything exactly as advertised.

I doubt that it's "mil-spec" rugged, but it wasn't "mil-spec" costly
either. I just use normal care when using it.

Happens in 2 HTX202s that I know of -- a spur on 146.76. One guy sent
it back to r.s. and they said that it was working "within specs".

Great suggestion, Gary, I'll hafta look for a color tv rock in there.

You are right, a rash of bad legislation will probably be proposed.

I find it ironic and a most sorry state of affairs that the release of this tape came about after it had passed through the hands of his party's senior representative on the House ETHICS committee! In direct violation of the Communications Act of 1934, not to mention that silly thing they passed in the '80s. Another case of Congress' not following its own laws. And they wonder why the public are so disillusioned with them!

I want to see him do jail time and pay a $10K fine here, under the Communications Act's "thou shalt not use or divulge the content of communications that are not addressed to you", not the [unenforceable] scanner law's "thou shalt not listen to cell or portable phones". Since that law is unenforceable, it ought not be on the books. And if the cell phone builders wanted them to be private, they should have built encryption into them in the first place. They ought to come with a big fat warning label.

And now that couple are giving a press conference with a lawyer / spin doctor coaching them, pleading that they are sweet and innocent, and only wanted a piece of history. Give me a break! Tell it to the jury.

Has it been divulged what model scanner it was? Even if it *was* a new 800-blocked one as they said, it could have picked up the cell phone on an image.

Hi,

I started this thread. Although I like most of what gary recommended, I would still insist on using a DSP based sound card (like the cardinal or orchid). DSP makes an incredible difference when it comes to weak signal recovery.

I'm willing to host a mailing list to start a discussion. Anyone interested?

Hi.

It's quite simple, really. If you look on the bottom side of the
radio, you'll see holes where a tuning tool can be used to adjust a
set of coils. These set the BFO carrier frequency for USB/LSB
independently and determine the frequency response through the SSB
filter. This affects both TX and RX. A copy of the service manual
will give you the procedure. I'd outline it for you, but the manual
is 300 miles away :(

An easy way is to tune to WWV at 0 beat, or where LSB sounds the most
natural. Then, without changing the VFO frequency, adjust the USB
slug until the audio quality matches the LSB. Be sure the IF shift is
centered. This procedure assumes that it is your USB carrier
injection frequency that is off and not the IF shift circuitry.
Otherwise, this procedure should get you within 100 Hz, good enough
until you can raise a service manual and some test gear.

Don't be afraid to experiment a bit. The 820 is a hardy radio and
still simple enough that it can be understood and worked on.

Source record: 186235

One other thing you can try that worked for me: put some shielding or rf-resistant item between the CRT and the radio. It turned out that in my case, it wasn't the computer but the monitor that was the problem. I simply put the computer between the monitor and the radio and that took care of that. (The computer was on end so to be the same size as the monitor wrt height and depth.)

Sell Johnson 949 UHF repeater. unit is old but was working when removed.

Tx does not have power amp, tripler output at about 3 to 5 watts to
drive PA. I have the manuals.
Currently crystals for Tx 450.150 Rx 455.150 PL 151.4.
The unit is without duplexer.

Any body interested? Make offer + shipping

If you pick up at Ft. Wayne, IN will include wall mount swing out rack
cabinet.

E-Mail MRKyle@concentric.net

>

My mla2500 roadmap says these 5 caps have a rating of 500v. I don't know of any source of 500v electrolytics. From my own experience, 500v is really pushing the envelope for an aluminum electrolytic cap.---i.e., they don't seem to last as long as lower v rated electrolytics. I would be tempted to go to 7 400v units or to 6 450v units, using more C per unit. One source of Panasonic/Matsushita filter caps is DigiKey 1 800 344 4539. 150uF is not really enough C. I would use the largest amount of C that will fit comfortably. The Panasonic/Matsushita filter caps are of a new compact design that packs in more C per cubic inch, so you should be able to get more C and have room for the extra one or two capacitors. The new cap. arrangement can be mounted on a 1/8"-t acrylic sheet rectangle---covering the original cap. mtg. arrangement. Electrolytic caps can be easily mounted on the acrylic, sheet upside down with silicone rubber adhesive/sealant. Allow a mm or two between caps for air circulation. The equalizer resistors can go directly across the capacitor terminals. Since heat rises, that way the caps. don't get roasted by the equalizer resistors. Also, the carbon-comp. equalizer resistors Dentron (Dennis Haad) used are not stable. They should be replaced with Matsushita 100k ohm 3w mof resistors, which are also sold by DigiKey.

1202. Icom program in RAM ???

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: hduff@ica.net
Message-ID: <32dd509a.0@lightning.ica.net>
Source record: 185996

I just aquired an ICOM IC-271A 2 meter all-mode transceiver and
after a quick look at the schematic I noticed that they used their
nasty RAM board scheme to store program code.
Wondering if anyone has experimented with using an EPROM
to store the code ?
Someone told me that there is actually a board like this on the
market... Who ?...Where ?

I'd like to hear from anyone who has any relevant information.
Thanks de Hugh, VA3TO

eek@rworld.com
I would avoid getting the usual 2 meter ht. You will
outgrow it quite soon. A dual band 2 meter/440 mobile
with a 12v power supply makes a good base rig and can
be used mobile later when you replace it with an all
mode rig. FM for the repeaters and ssb for weak signal
work. A tnc and some cables gets you on packet for
more fun and games. A good outdoor antenna is worth
more than a powerfull transmitter. You can build a
5 element 2 meter quad for about 10 bucks and with
a cheap tv rotator you will really get out there.
Make some friends on the local repeaters and have a ball.

1212. Ni-Cads & HT's

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: ccartee@cisco.com
Message-ID: <ydriv4ya3hp.fsf@griffon.cisco.com>
Source record: 186006

I would like to understand the issues surrounding the use of Ni-Cad batteries in my HT's (Yaesu FT-51R) battery case. The HT has a battery case which can accept 4 AA batteries. So rather than fill it with Alkalines, I want to fill it with RS Hi-Cap nicads.

Note that I don't intend to charge them in the HT, just use them for power.

The owner's manual says that this is a no-no. I am trying to understand if there are valid technical concerns or if there is some business motive behind the warning...

Thanks

1214. Re: 6 meters on new HF rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: AL7OQ <mfeldmn@ibm.net>
Message-ID: <01bc028c$2149e860$8ddb48a6@jerusalem>
Source record: 186008

Those of us who enjoy six meters will never understand your point of view, either. Who cares if there's no local activity? I consider 6m a DX band, and that's what I like to work. When there's e-skip, it's like 10, I'll talk halfway across the country. I don't look for locals on 6m any more than I do on 15 or 20.

Also, an extra $200-$500, depending on the rig, is a whole lot less than a seperate 6 meter rig. This isn't "driving up the price", it's reducing the cost of the ham shack. I look forward to rigs like the IC-708 or the new Yaesu, which promise to add 6m, 2m, and 70cm to an HF rig. Imagine, a whole ham shack in one tiny little box for under $1500! A few years ago that was unthinkable.

6 meters is far more active than when I first got on the band 13 years ago, and 2m SSB/CW activity is also up. I've worked almost 2,500 miles on 2m on one rare occaison. I look forward to more, and these new radios contribute to the activity.

Finally, I think what's driving the market is simple supply and demand. The early HF+6 radios (TS-680, IC-726, etc...) did very well. The radio companies are in business to make money. I would probably not have bought another HF rig so soon if these little marvels hadn't come out. They (in this case Alinco) successfully made a customer out of a non-customer. I doubt I'm unique. I think an IC-756 may replace my well used IC-740 if it's as good as the literature makes it out to be. It seems to me that responding to a demand in the market is smart business. That's my answer to your "*Why?*"

Cross-posted to: ucb.market.misc,ba.market.misc,rec.radio.swap,rec.radio.amateur.equipment

As the subject line says I've got an Alinco DJ-580 dual band transceiver for sale.

Price is the best offer (which will approximate the fair market value of
this unit (I've seen upto $350 recently)). No trades
please.

This unit is a must buy because:

1)It is in mint condition. It has minimal usage. It has been looking at
me for the last several months and asking when it was going to get an
owner that wanted to use
him.

2)Has expanded aircraft receive enabled.

3)Lots of goodies: DTMF squelch, full duplex and cross band repeater
funtctions, compact size, etc...
etc...

Please buy this unit. There is a special price in it for you.

Thanks,
Rev. Alan Gutman
KE6WFO

I have a GLEN custom 1600 for sale. It uses 4--4CX250R ceramic tubes. It
is
in PERFECT shape in all meanings of the word! If you havent heard of this
amp, I'll tell a little bit about it. The band-width on this unit is 40-2
meters.(about 7MHz through 145 MHz) It will take an input of about 4
watts-100 watts,(adjustable on rear of unit). It has an input on back for
direct key-up(re. footpedal). It runs on 120v ac. it has variable output(
kinda like the texas star 350 w/ variable). It has a built in watt meter,
that reads RMS, and is very accurate. The output is 1700 watts rms, 2700
watts peak, depending on how you drive it. This amp is beeing offered to
the
serious only. Not a scratch on it, no discolorings, no blemishes. very
PERFECT condition. Comes with origional paper work, schematics, and custom
slip/dust cover. Weighs about 90 pounds. 1800.00 + shipping, please dont
respond unless your serious,,, 73's, and happy modulating,, STRESS TEST.

MilSpec doesn't necesarily mean that if you drop the radio off a cliff
it will transmit. MilSpec is anything from the color of the paint,
what percent is oilbased, etc to what brand capicitor is used inside.
Some radios can be dropped off a cliff and run over by a tank and
still run, even non-milspec'd radios.. It's so easy to get a MilSpec
and not a lot of people think about the above and see a "Mil-Spec!" on
a radio and buy it for that reason.

For Sale:

Kenwood AT-180 Tuner, this tuner matchs the TS-180,
(it is indentical to the AT-230 except for color and
nameplate). Tunes 160-10 meters, has SWR-Power-output
metering, antenna switch controls two coax fed antennas
and an end-fed wire. it has few scratchs on the sides, but
it's clean and works perfectly.....$100.00

Kenwood VFO-180 External VFO, again this matchs the
TS-180S, but will work on TS-120/TS-130/TS-530/TS-830
radios also, with cable, again the sides are scratched
up but it is clean and works perfectly...$65.00

i'll also need $6.00 extra to ship either unit...

Hi Larry,

I'm just about to put together an unused kit for one of these. Does it
tune OK on 12m and 17m using I assume 10m and 15m taps as I do on my
SB200? I use 17m a lot so was wondering if the plate tank needed the tap
shifting a little.

Best regards

Duncan

1231. ICOM W21at 440->430 transmit change

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: geoffm@cs.cs.huji.ac.il
Message-ID: <5biagq$nuf@news.huji.ac.il>
Source record: 186047

Hi,

I have an ICOM W21at that I would like to change the transmit range from
440-450 to 430-440. I would prefer not to "open up" the transmit range.

I would not like to change anything else, e.g. I need the tonepad
and CTCSS options.

If you have information on how to do it, or know of someone in Israel
who will do it, please let me know.

Thanks,

Geoff.

REVIEW: Shortwave Receivers Past & Present, 2nd Edition, Fred Osterman

This guide covers communications receivers from 1945 to 1996 and details information on over 500 table-top models. The radios it deals with are not ordinary table broadcast units but specialized pieces of equipment made for amateurs, short-wave listeners, military and government customers. Many of the older receivers are highly sought after by collectors, hobbyists and hams who are interested in "Boatanchors", a term of endearment for older, tube-based (and consequently heavy!) equipment.

Initially there is information on buying a used receiver, restoration and repair, a bibliography of periodicals, publications, clubs and on-line resources on the subject as well as an explanation on how to use the guide. Each manufacturer is given a chapter. A short discussion about the company, its logo, addresses and other general information follows. Each model is generally given a half-page with just about everything you'd want to know about the radio short of having the manual. Just some of the listings include features, specifications, circuit compliment (tubes and their function where applicable), accessories, comments, variants, where and when made, voltages, a neat symbol that indicates the type of frequency readout used, size, weight, etc. There is information of interest to collectors too, such as an estimate of rarity, new price and a general price range of current prices. The guide even has a section of radios that never were such as the Hallicrafters SX-112 and others!

Also included are the "dream" receivers - high-end equipment that most of us will never see - with names like Watkins-Johnson, Rohde & Schwarz, Harris, Racal, etc. Its nice to look at the pictures and enjoy the descriptions.....

Shortwave Receivers Past & Present is very well illustrated and produced. The author really knows his receivers, choosing models that are of major interests to hobbyists. As an example of this, Osterman has included certain military receivers such as the Collins R-390/URR and its younger brother the R-390A/URR because they are of great interest to hobbyists. Also included are the sought-after Collins 'A' and 'S' line receivers. In addition, some rare and virtually unknown receivers such as the DAVCO DR-30 and the Mosley CM-1 are included. Many of the receivers listed are from other countries. Nineteen pages is devoted to Eddystone which is a well-known British manufacturer. I found the price information pretty consistant with what I've seen on the Net and at some flea markets. A nice touch is that the author quoted a few of the

radios' values in Japanese Yen as well! Japanese enthusiasts are well known at larger US hamfests for buying up nice clean Collins and other American-made radios.

This guide is a very complete collection of equipment from all over the world and should be of great interest to anyone interested in radio receiving equipment. It is available from the publisher.

The possibility exists that Gingrich was using a digital system but the
other party was using an analog phone, making any "security"that a
digital system offers useless.

The call could then easily be taped in Florida even if he is in D.C.

The same thing has happened here with a local politician. They were also
happily rebroadcast by the media who seem exempt from the penalties
prescribed to lesser mortals for such interception.

EXCUSE ME!!! GE MSTR II is a hell of a lot better than MSY...I worked on lowband gear for the last 15-20 years....GE , Motorola, etc....MICOR sucks on lowband because the NB can get clobbered by off freq signals too easy....MOTRAC sucks because the squelch ckt....the rcvr DOES hear good but personally I like GE MSTR II and EXEC II for their overall performance....the squelch in a MSTR II is a hybrid IC...works a heck of lot better than the FLAKY squelch in MOTRACs....maintained a fleet with over 500 units....when we threw out the Motracs, we danced in the street! and we wish we couldve done the same with the MICORs (we did later when we went 800Mhz)

Now as for the problem, I would suggest looking at the site when this happens.....take a spectrum analyzer and plug into the rcvr feedline...could be something on the input....
Bill, take OFF the preamp....the GE MSTR II rcvr STOCK condition typically hears .25uv...if yours doesnt, its broke.....dont need the preamp, trust me....A Mosfet on a single site repeater is also bad BAD BAD!!! Overloads, etc too easily...IF you ever run a preamp, a GASFET with a helical front end is best but try NOT to run a preamp at a rptr site...much better if the rcvr can hear good without one...

Let me know if I can be of more help...I am QUITE familiar with GE MSTR II....the fleet I maintained had over 200 MSTR IImobiles and 3 MSTR II bases.....and one MSTR IIe base...and I would take them anyday over MOTOROLA...especially the MICOR...(the GE would beat the heck out of the MICOR at noisy locations because its NB was better....which BTW, since you are running single site, I take it you are NOT using the NB? Kinda hard to do in single site operation...which is why my 6mtr rptr is using split site..btw GE of course!)

1244. Re: 6 meters on new HF rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: "Christopher (Chris) W. Boone" <cboone@earthlink.net>
Message-ID: <32DCFC9E.77BF@earthlink.net>
Source record: 186060

Hi Meade!
The recent surge of 6 is fueled by a couple of factors...

1) 6mtrs is becoming an active band in Europe...Britian in fact in the last few years got access to 6 because it was for a long time a TV Channel (remember what is true in the US is NOT overseas)...More and more European countries are getting 6m segments (not as large as us but they are there!)..
2) NO code Techs are wanting to do something else PLUS Tech Plus ops can use the HF+6 on HF CW/SSB on 10 and all modes on 6 and when they upgrade, they can still use it...
3) we are now in the upswing of the sunspot cycle and 6 is fixing to start hopping again...it cost the manufacturers less to add 6 than build a single band radio (the TS60 is a good example of this) so why not include it?
4) 6 is almost a MIX of HF and VHF operation...good local operation but when it opens, it opens! More than 2 mtrs.....

Hope that helps explain it....
Chris

1250. icom 706 - out of ameteur band xmit?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: ed finn <ed.finn@ustc.vlsi.com>
Message-ID: <32DD33B6.66C5@ustc.vlsi.com>
Source record: 186066

hello,

I am trying to find the resonant freq of a new antenna on 40/20/15/10 so I can
trim the spokes into resonance in band. The antenna is supposed to resonate, out
of the box, at or below the low end of each band.

Does anyone know if the radio can xmit out of band at low power to make these swr measurements?

Also, I have the offset for repeater operation set to -600 khz, but it is not easy
to set vfo B to +600 when needed above 147mHz. Has anyone found a slick solution
for this situation ?

tnx in advance,
Ed

Ed,

I am a bit confused by your post, you mention an HF antenna, and then a 2 meter frequency, are you trying to use this antenna for both, or for 2 meter (144-148) only?

I give you kudos for taking the effort to trim the antenna and make it match, and not just let it go and use an antenna tuner. However it is not legal to transmit even low power on a frequency you are not licensed to use, that means you generals who always use the extra CW portion of 80 to test you bandwidth as well.

There are some good instruments you can use rather than transmit to test and tune your antenna tuner. MFJ while I don't use their stuff myself has some good test equipment for antenna work. The Palamar noise bridge is an excellent inexpensive way to tune HF antenna's. You turn on the noise bridge and find the null of the noise with a reciever, and that is the resonate frequency of the system. There are also plans that are fairly simple in the mid 80's ARRL handbook for building one yourself.

Even without any of the the above, you should be able to detect a difference in the SWR from the top and bottom frequencies you can transmit on each band. If you can't I would check all connections and the coax and the joints on the antenna.

Good Luck

Sparky KI5GY

1258. ICOM ICW21A - Dual Band Handheld for Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: Scott Hatten <shatten@ee.net>
Message-ID: <01bc0275$c1d19ba0$8723e6ce@scott->
Source record: 186074
Cross-posted to: alt.ham-radio.packet,alt.radio.scanner,rec.ham-radio,rec.ham-radio.swap,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.swap,rec.radio.swap

I have the folling to sell as a package:
1- ICOM ICW21A (Dual Band Handheld)
Will recieve from 50mhz-999mhz
5watt,Dual Band, Battery Pack
1- ICOM SpeakerMike - W/DTMF Pad
1- ICOM Spare Battery Pack (W/Microphone in Battery)
1- ICOM/KENDOO Rapid Charger (1 Hour)
1- ICOM Case for Radio
1- 35Watt Amp/PreAMP

I have the original boxes and all the manuals. This unit is in perfect shape.
Would make a great mobile rig (giving you 35 watts of output).

$250.00 takes it all including shipping.

1261. Correction: Info: AT-250 Automatic Tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: Chris Allingham <va3zc@nortel.ca>
Message-ID: <5bjd05$49q@bmerhc5e.bnr.ca>
Source record: 186077

I got a couple of replies saying that the tuner that matches the TS-430 is the AT-250 not the AT-430. I should have double checked before sending my last posting. So, my questions should be in reference to the AT-250.

Will the AT-250 tune a random wire? Does it have post for a random wire or balanced lines or does it just have coax terminal inputs? Does it cover 160-10m? What is a fair price for a used AT-250?

Chris va3zc@nortel.ca

1269. Questions about Yaesu two-slot rapid charger for FT-50 and FT-51

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-15 00:00:00 UTC
From: obrien@Aero.org
Message-ID: <5bjm5r$olq@news.aero.org>
Source record: 186085

The rapid charger for the old Yaesu FT-470 was the worst rapid charger ever seen by the field of amateur radio, just about. The only protection it had was a timer. If you put in a less-than-fully-discharged battery, or if there was any interruption in power causing the timer to reset, the result was a battery that was cooked down to a soup bone. Yaesu wound up giving lots of folks in my radio club new batteries to replace the ones cooked by this charger.

Now we have a new dual-slot charger for the FT-50 and FT-51R. The question that springs to mind is: what's inside it? Does it have a Delta-V detector? Does it have a timer? Do the battery packs have temperature sensors? If so, does this charger read those sensors? Does it use one or another of the commercially available battery-charger control chips?

Greetings.

I'm planning to go for my Novice (or even Tech+) ticket, and would like a little advice on choosing my first (HF) rig.

I have leads on a Yaesu FT-301 with power supply, external VFO & mic, and on a Kenwood TS-520, both for around $350.

Is this a fair price, assuming both radios are in good working order? What are the relative merits/disadvantages of one rig over the other?

If you want to email replies, please do so to Jay.Mottern@ci.seattle.wa.us

Thanks.

>Also comes with a spare set of PA valves worth =A350

This came out looking like this on my reader. This isn't in UK pounds, is it? Is an FT101 really worth this?

I recently inherited by Dad's old FT101E, plus external VFO and matching linear amp. In general, the unit seems
to have lousy sensitivity, and may even be broken (I can't pick up anything on 160 or 80m.) Using a 6 ft piece of wire hung off a transmatch, I can receive the local 28.2 beacon but have detected no other activity there except for the odd local packet station; could be the band is just dead. I can pick up the local 14.1 beacon,with occasional snippets of the beacons in Canada and New York. On transmit, the unit seems to put about 180 W into a dummy load, and this falls off to 100 on 10m. (Could be my meter.)

I look forward to using it once I pass the code test in the next few weeks, but I don't want to embarass myself and not be able to receive anything. The cost of a new HF rig is prohibitive for me, considering I live in a condo and will never be able to erect a decent antenna.

Thanks in advance,
-Wiley KF6IIU

>
>Thanks,
>Bill Crocker

I tested an ICOM R8500 for my Scanner Equipment column
in Monitoring Times magazine and liked it enough to buy one
for my own use.

Most DC-daylight receivers are a compromise, but the R8500
is an exception and works well across a wide spectrum.
Haven't had intermod or image problems thus far.

It's easier to use and the construction is much more
rugged than the R7100A, another receiver I enjoyed.
It's heavy because the circuit boards are bolted to a thick,
cast aluminum chassis.

My R8500 is pretty sensitive up through 1,400 MHz,
then starts to become less sensitive.

See the current issue of Monitoring Times (Jan. 1997)
for a full report, including my sensitivity measurements
up to 2,000 MHz in graphical form.

Reprints of articles from Monitoring Times are available
for $2.00 each plus a self-addressed stamped envelope from:

Grove Enterprises, 300 S. Highway 64 West, Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

Note: I don't get any part of the $2.00.

>recovery.

Tell us where we can buy a Cardinal or Orchid card with the PSA chipset.
I've had the local distributors looking for them with no luck. They all
had them at one time, but they seem to have disappeared from the market.
I strongly suggest that we not base a development effort around hardware
which is of dubious availability. We need a stable platform which will be
easily available for several years to come.

DSP is DSP whether we do it on dedicated hardware or on the main processor.
The PSA chipset gives us about 40 MIPS, but we can do that on the main
processor now. We don't need special unobtainium cards for most of the
DSP we would need to do. (Now exotic stuff still needs special hardware
acceleration, like the 56001 in the PTC II, but the PSA equipped sound
cards aren't in that league.)

Wilmington, DE 19886-5515

Check your billing statements closely. If you have been charged a late fee even though your payment was mailed prior to the due
date you should report it to your state attorney general. If your finance charges are being listed as purchases you should contact your
state attorney general. If your credit card company is unable to funish a copy of a signed billing receipt you should notify your state
attorney general.

All the events described above could make you a party to a class action suit against your credit card company where you could
collect up to ten times the amounts you were falsely charged.

For more information contact your state attorney generals office.

>accessories for $225. Oh yes, and it was in excellent condition also.

First, It's not my radio or my price, read the top of the original post. Second, you can't buy one new for this price because they don't make them or sell them new anymore, the 582 has less receive and has been downgraded. Third, I have seen some others going around recently, and I don't think this price is too high. There was one posted a day later, without the 5W battery for $350. Fourth, it does say negotiable, so if you had any interest in buying it, no one said that price was written in stone. Fifth, if you don't want it, don't buy it.

>is measured? Any comments on the model? Likes or dislikes?
>Thanks in advance for any information!

Hi Scott,

Overall I love mine. However, just so you have been warned, it isn't perfect. Here are the downers as I see them. As you'll see, they are just minor gripes about a really nice radio:

1. Like most ham gear, the 100 memory channels are not organized into banks the way scanner receivers are. If you want to scan, you have to lock the channels out one by one. It sure would be nice to be able to cut banks of channels in and out.

2. The radio uses a unique single pin plug for the extension microphone. (It infuriates me when manufacturers force you to buy all new accessories !) If you have a 2-pin mic already there is an adapter available but it's big and awkward, and you can't pick up the plug as a part except via Yaesu dealers, which may be less convenient than your local electronics parts dealer. Remember this when budgeting.

3. Similarly, the power plug is a Yaesu special item. More $.

4. It has a lot of clever features that you probably won't ever use. For instance, it will auto-transpond with other FT50R's so you can track whether your friends are in range. (How many of your friends have FT50R's also?) It will record up to 20 sec's from the mic or off the air, but won't autostart - try recording a CW station ID, for instance, by the time you press record, it's half over.

5. You can only access two of the four power settings from the front keyboard. One of the two is full power. To get the others takes a fair number of keypresses, involving manipulating the big knob on top of the radio..

6. The keyboard beep, if activated, sounds every time the radio stops on an active channel when in scan mode (Apparently this is a Yaesu thing - my FT2400 does the same thing). You can disable the beep but then you don't hear it ever eg when pressing keys.

7. The antenna sucks. Budget more dollars. It's an SMA socket, so if you want to connect to coax or a BNC plug, you need another adaptor. More dollars.

8. Its tiny size has its down side - if you have big hands it's hard
to find a comfortable way to hold the radio and not accidentally press
a key. Fortunately the keyboard lock is well thought out. Also, there
is no easy way to lay the radio down securely on its side, especially
if you have the belt clip installed - it will roll over if jiggled..
If you remove the belt clip there is a stub that sticks out.

By now you probably think I could find the down side in
just about anything. Just try to pry my FT50R away from me
and you'll see how much I like it. :)

FYI - International Crystal Has a WWW site. Do not know URL,
but originally found it with an AltaVista search on "International
Crystal" - of course, it also dragged up a jewelry company in Nepal.

One possibility is that the four NiCd batteries won't produce enough
voltage to run the radio. Alkaline batteries produce about 1.5 volts
each, while NiCd batteries produce 1.25 volts maximum each, and the
voltage drops off as they get weaker. Four NiCd batteries offer a
whole volt less than the alkalines.

As an aside, I have an old Icom 2AT. I have six NiCd batteries in
the six-cell alkaline pack (two packs, in fact) and there are no
problems. The IC-2AT will run on 7.2 volts (the standard BP-3 is
a 7.2 volt pack).

Source record: 185966

Eric,

Good luck with your test. Nothing to "dread", and I hope next time I see you posting it's with a callsign, or better yet, let me hear you on the air!

As to what kind of radio to get, that depends on your interests and how much money you have to spend. You can buy used or new, base, mobile (which can be used as a base), or hand-held, multi-mode or FM only... The choices are limitless.

I'll make two (probably incorrect) assumptions: 1) that you are willing to spend a fair amount of money if the amount of pleasure you get is enhanced sufficiently, and that 2) you want to do more than just talk to a few people locally on an HT (Ham term for "walkie-talkie").

First, let's start with those "few people locally". The place for that is 2 meter FM. This is probably the most popular form of ham communications there is, and rigs are plentiful. Make sure if you are buying used, and FM-only, that you buy a synthesized rig with programmable PL frequencies. (PL [Private Line]is a Motorola trade name for a subaudible tone used to open a repeater.) Without a PL board, you will be limited to a much smaller number of repeaters, particularly if you live in a major metropolitan area. Used, modern mobile rigs which meet this description will start around $150. New ones start around $250, and go up to about $400.

You may also want to consider a multi-mode rig. Single Sideband (SSB) and that dreaded morse code (CW) do exist on 2 meters, and can, when the band is open, provide communications up to 2,500 miles under the best of conditions. These openings are sporadic, unpredictable, and happen most frequently during the late spring and early summer. They're also great fun. They require a more expensive multi-mode rig (about $650 for the cheapest new one, used ones start around $200) and a decent, horizontally polarized antenna. A beam is best, but if you live in an antenna-restricted area you can get by with a small loop antenna, such as those made by m2. Since this type of communications is more expensive, not reliable, and requires a little more skill, it is not nearly as popular as 2 meter FM. What do they say, "no pain, no gain"? You will find enough activity to keep you interested.

The best band for "weak signal" work (a misnomer, sometimes the signals are very strong) is 6 meters. When things are right, particularly at the peak of the sunspot cycle, which is now on the rise, you can work the entire world on this band. It opens in more ways, and therefore more frequently, than 2 meters, but is still totally unpredictable.

Rigs are fairly pricey--expect a good used all-mode rig to start around $350, new ones start around $700. If you plan to upgrade your license and pass a code test (and you should!), you can get a rig which has 6 meters, 2 meters, and all the HF bands in one box for under $1200 NEW! (It's called an Icom IC-706.) It's not the best rig in the world, but it will do everything you need and then some.

Another possibility is satellite work. This requires more skill, more effort, and a fair investment. Read up on it. For a no-coder, this is the only reliable way to get world-wide communications.

I hope I've given you some food for thought!

73,
Martin

>improve things, rather than waiting around on the likes of AEA. And things
>are headed that way already in the Linux community anyway; people are
>discovering the alternative uses for those Soundblasters.

With a DSP (software) approach you have the flexibility to continuously
improve things, but this flexibility is only theoretical.
To really do something, you need competent DSP software writers, and it
seems these are even less available in the amateur radio field than
competent hardware designers.
This has frustrated many DSP projects around the world: in the beginning
there is excitement about what this new board can do, then there appears
some software to do the things that we already could do in hardware
(e.g. G3RUH modem, AFSK modem), but when it comes to developing really
new things the progress is much, much slower.

Besides, we are trying to speedup packet beyond the point that is
reachable with commonly available DSPs and audio codecs, and thus it
will be even more difficult to be at the leading edge with DSP modems.

The medium-speed packet radio modems that are now popular (DSY 56kbps
modems in the States, speeded-up G3RUH FSK modems in Europe) are not
based on DSP technology (better: not based on general-purpose DSP with
custom software that could be modified for further improvement).

Also it is not cost effective for an Amateur Equipment manufacturer to make
a single band 6 meter radio any more. Typically sales of such a radio are
so slow, the manufacturer looses money trying to manufacturer it..

I called around and found a couple of Dealers who were taking orders
for $2150 USA DOLLARS. I bet the price will come down once the radio is
out 6 months. For instance the Icom 706 cost $1300 at first but then
came down to $1189 USSA DOLLARS plus includes separation Kit.

1327. dual and tri-band HT questions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-16 00:00:00 UTC
From: Bert Herald <herald@asu.edu>
Message-ID: <32DE4635.2984@asu.edu>
Source record: 185982

I would like to get the Icom delta-1 triband HT, but haven't heard anything about it. Does anyone own one? Can someone tell me how it compares to the other triband or dual band radios with regard to noise immunity, features, and ease of use? I don't need a lot of features, extra frequencies, etc, because I know that I'll never use them. All I need is to transmit and receive on multiple bands in one rig, I don't see myself needing a repeater function or to do a lot of crossband work. But what I do need is a good receiver, and I want to have 440 and 1.2 gig bands. However, if the triband rigs (and the only ones I know of are the Icom and Standard models) are poorly designed compared to dualband units, I'll have to take that into consideration. People have raved on this board about the FT-50R. How would this rig compare with the Icom tribander from a strictly noise immunity standpoint?

Please email your replies to me at herald@asu.edu if you could! Thanks very much.

Bert, WF7I, Tempe, AZ, USA

Check the circuitry connected to the RUS (Receiver UnSquelch) line...also check the channel guard decoder board and it's soldered pin connections on the "motherboard" or as GE calls it, the system board. Also, GE soldering jobs SUCKED! Check every connection you can by resoldering all you can get at!! We have approximately 300 MASTR II's (UHF) that I fight with daily. The new digital Motorolas will be arriving this month, THANK GOD!

Anyone know anything about the BC 654 A ?

I have a friend refurbishing his WWII jeep (1944 Ford GPN) and
someone gave him the BC 654 A (in very nice shape) for it. We
would like to find the approximate vintage of this radio and
we would like to know what service it may have been put to.

Any help would be greatly appreciated.

1346. TS-570D questions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-16 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <853423458.19031@dejanews.com>
Source record: 186029

Hello, I have a few questions for any owners of the TS-570D. I'll probably be purchasing one at the Richmond Frostfest this Sunday. Any replies before then would be really helpful!

1. I used to own a Kenwood TM-241 2-meter rig. In one year's time, the labels on the rubber keypad buttons on the 241's microphone wore completely off. Now, I know a mobile mike is in a more harsh environment, with constant handling, sweaty palms, etc., but I don't want to have to replace the 570's front panel keypads after a short time! This may be a hard question to answer since the rig is so new, but have any of you owners taken a good look at them? Do they appear durable?

2. I live in a townhouse and I could only put up one "hidden" antenna. I was fortunate enough to hide a full-size 80-meter dipole in the woods behind my unit and that's ALL I plan to put up. The current rig I'm using, a borrowed FT-890, is able to find a match for it on all bands including 160. How's the tuner in the TS-570D? I've read that it's a little different from most tuners in that it does not use motorized tuning capacitors. How does it handle mismatches like the one I'm talking about? Anyone out there had any experience like that?

3. QST's review of the radio had several criticisms. The one about the multitude of uses for the MULTI knob I'm ignoring, since I've played with the TS-570D at HRO and I don't think I'd have that problem. But what about the tuning steps? QST said the 10-hz "default" step was "too fast" for normal operating, and that the 1-hz "fine" step was too slow -- especially for the RIT control when that tuning step was selected. Opinions?

4. QST also said the TS-570D's fan was "somewhat noisy." Really? Or were they just being a little critical in an otherwise excellent product review? The fan in the FT-890 is audible too, but far from objectionable. Again, opinions?

Allow me to thank you in advance for replying to this query. I'm just about to drop some cash on a new HF radio and I want to be SURE I'm making a good decision! (I also want to be happy with whatever I get because my new wife has had enough of Food Lion beef stew and generic shampoo for the last three months! She'd better see me pleased with what I get or ohboy!!!)

Any other comments or criticisms on the TS-570D would be
GREATLY appreciated as well.

73,

Meade, KA4RQB
Richmond, Virginia

Your power output readings are accurate, although I was able to bump my FT-101's output to 250W with a few mods on a new pair of finals a few years back (since I don't operate much anymore due to school, I don't know how much sooner they'll burnout, but the oomph is nice!).

As to the sensitivity, it sounds to me as though it's malfunctioning. Possibly, the band switch mechanism needs to be cleaned well, as it occasionally will foul. Get a professional grade contact cleaner from a QST advertiser, as the RS stuff doesn't seem to last very long when I use it.

I have no experience with the latest high-tech wonders I see advertised nowadays, but I have been well-pleased with my FT-101 for twenty years now. In its day, it was top-of-the-line and well respected. I believe it will be a wonderful rig to discover the joys of amateur short-wave operations.

Enjoy!

Source record: 185842

>But why is it so popular on the

>current crop of HF rigs? After all, it's a VHF band!

The technology has at last become inexpensive enough to enable this so
wide coverage. Before long, hams will be able to buy "DC to light"
transceivers that have HF,VHF, and UHF. Scanners are made to cover LF
microwaves, so why not amateur gear.

I think it is good; it makes it easier for folks to explore all of the
we have. When I was first licensed ('78), one was lucky to have good R
performance above 14 MHz;; going all the way to 50 or 144 was unheard

1359. PicCon Hidden Transmitter Hunt Controller

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-17 00:00:00 UTC
From: byon@netcom.com
Message-ID: <32dfdec5.10110239@news.hlc.net>
Source record: 185845

Greetings to fellow T-hunters and T-hiders,

I have recently created a new microcontroller-based hidden transmitter controller called PicCon. It connects to a radio transceiver and produces tone sequences and Morse code messages at user-programmed times. It is completely field programmable via DTMF tones, remembers all options even when power is removed, runs off a 9-volt battery (or any 7-35VDC source), and is quite compact (1.9" x 1.7" PCB.) PicCon also supports synchronized multi-transmitter hunts, and can operate under IARU T-hunting standards. Look for it in the March 1997 issue of 73 magazine in Joe Moell's Homing In column.

Kits are available, which include a manual, and all parts necessary to build the printed circuit board, excluding a chassis. A power/radio interface cable is also included, but must be wired for your specific radio. Kits are $49 plus $2 S/H and can be built in about 30 minutes.

Further details can be found at the PicCon Web page where I have on-line copies of the User's Manual in PDF, HTML, RTF and TEXT formats. If you do not have web access, I would be glad to eMail a version to you. The web page URL is:
http://www.kvoa.com/byon/piccon/
Additional questions can be directed to me via eMail.

Thanks, 73, and good hunting (and hiding.)

1362. Re: Questions about Yaesu two-slot rapid charger for FT-50 and FT-51

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-17 00:00:00 UTC
From: Michael Aust <maust21401@earthlink.net>
Message-ID: <32DFA7FB.4863@earthlink.net>
Source record: 185848

I have two FT-50R's and use the rapid charger, I have put batteries that
went thru a 10hr charge on the slow charger,then put them into the quick
charger(NC-50).
within 2 minutes, the red light went to green showing the battery was
charged, it seems the charger stop changing when the battery voltage
reaches a certain full charge thesehold.
Have not had any overheated, hot batteries, from trying to charge
as you describe.

>to be able to cut banks of channels in and out.

Very true.. Almost.. maybe NO ham rigs have banks.. They're not
scanners. They're amateur radios. Remember, we shouldn't listen out of
band! =)

>2. The radio uses a unique single pin plug for the extension
>microphone. (It infuriates me when manufacturers force you
>to buy all new accessories !) If you have a 2-pin mic already
>there is an adapter available but it's big and awkward, and you
>can't pick up the plug as a part except via Yaesu dealers, which
>may be less convenient than your local electronics parts dealer.
>Remember this when budgeting.

Not entirely true.. Almost all radio manufacturers use their own style
plug. Why? More money. But Scanners Unlimited up here carries the
mike. He's not a yaesu dealer, as far as I know.. But it's the same
accessories as the VX-10 commercial rig, so..

>3. Similarly, the power plug is a Yaesu special item. More $.

Again, that's going to be standard.. No two radios (even very few by
the same company) use the same adapters.. Enter W&W associates Battery
chargers! =)

>4. It has a lot of clever features that you probably won't ever use.
>For instance, it will auto-transpond with other FT50R's so you can
>track whether your friends are in range. (How many of your friends
>have FT50R's also?) It will record up to 20 sec's from the mic

Very true.. But that entices people to say "BOB!!! BUY A FT-50!!"

>or off the air, but won't autostart - try recording a CW station ID,
>for instance, by the time you press record, it's half over.

Not true. Press F for a second, then hold down TN/TS. The display
will show AREC, and record any traffic HOWEVER it will re-record over
itself everytime carrier drops and a new xmission comes in..

>5. You can only access two of the four power settings from the front
>keyboard. One of the two is full power. To get the others takes a fair
>number of keypresses, involving manipulating the big knob on top of
>the radio..

How many radios do you know have more than two settings? Now, that would be more buttons.. I kind of like the high / low button, rarely use any of the others..

>6. The keyboard beep, if activated, sounds every time the radio stops
>on an active channel when in scan mode (Apparently this is a Yaesu
>thing - my FT2400 does the same thing). You can disable the beep but
>then you don't hear it ever eg when pressing keys.

True.. Very annoying.. But I turn myne off, so I can't complain.

>7. The antenna sucks. Budget more dollars. It's an SMA socket,
>so if you want to connect to coax or a BNC plug, you need another
>adaptor. More dollars.

Open it up, and solder in a BNC antenna.. =)

>8. Its tiny size has its down side - if you have big hands it's hard
>to find a comfortable way to hold the radio and not accidentally press
>a key. Fortunately the keyboard lock is well thought out. Also, there
>is no easy way to lay the radio down securely on its side, especially
>if you have the belt clip installed - it will roll over if jiggled..
>If you remove the belt clip there is a stub that sticks out.

You can sure find a problem in anything, eh? It is small, which can be an advantage (I do photography and often don't want to be seen wearing a radio. I work around the elements (fire and accidents) and around big guys with guns (secret service) so often not letting them know you are listening to them can be fun!

>By now you probably think I could find the down side in
>just about anything. Just try to pry my FT50R away from me
>and you'll see how much I like it. :)

I was the same with my Saber III until I sold it.. =)

Anyone have any experience with the IC736 and computer control.
Does this rig communicate both ways with the computer.
I am using "Logmaster" by Sensible Solutions Software and it reads where the rig is as you log and you can tell the rig what freq to goto from packet call outs. This works fine with my FT757 and a friends TS450.

Your info is apprecated.
tnx Dick

A friend has one. The only complaint is CW at about 20 WPM or higher.
You get minor (maybe 20 Hz or so) random transmit frequency jumps. I
guess the same processor is used for frequency control and the keyer.

It is a niffty radio. I have had a several GP vhf/uhf receivers dating back to the nims-clark receivers. I have only had this one about a month.I really like this one. Yes there is some intermod, but very little. It is better that My FRG9600, Better than the R7100 and better in VHF than My FRG8800/VHF8800. The HF side also nice. I think as good,if not better that My FRG8800. I no longer have my FRG8800 so a side by side trial is not possible. All in all I like the unit and some day I will figure out all of the features it has.

Can someone tell me if it's worth getting a CW/RTTY/FAX decoder?

I am thinking of getting one but was told that besides CW most
stuff is encrypted. I would like to hear from people who already
own decodes to see if it's worth spending $500 plus for one.

I was also told that alot of signals that aren't encrypted
use special codes to send messages. If this is the case, it
sounds more like work fun.

Could a novice find these frequencies/modes or can a book be purchased
with this info?

Yes.

>I am thinking of getting one but was told that besides CW most
>stuff is encrypted. I would like to hear from people who already
>own decodes to see if it's worth spending $500 plus for one.

All you need is $5 to get into this. Look for HAMCOM22.ZIP
and JVFAX60.ZIP. Takes $5 to build the interface from 5
radio shack parts. You must have a 386 or better computer
to plug it into. Schematic is in executable. You can
buy the interface prebuilt for $20 from HAMS here.

>I was also told that alot of signals that aren't encrypted
>use special codes to send messages. If this is the case, it
>sounds more like work fun.

Yes, commercial RTTY is almost totally encrypted. However
I've had some luck using AMTOR/SITOR modes.

Ham RTTY is never encoded. Try 14080.

You can pickup extremely high resolution satellite FAX's
from Navy. They retransmit the Gig sattellite receptions
down to HF (8080,9090...)

You can pickup SSTV on 14230. I've gotten several dozen
great hAM color pictures here.

>Could a novice find these frequencies/modes or can a book be purchased
>with this info?

Poke around. The commercial stuff is roughly around 6400 and 8400 (??)

1380. Icom delta-1

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-17 00:00:00 UTC
From: Delbert Herald <herald@asu.edu>
Message-ID: <32DFAB1C.72D5@asu.edu>
Source record: 185866

I thought I'd re-post this, since I think the reply-to data was wrong on my
earlier post.

I'm looking for anyone who owns a delta-1 triband HT, or knows anything about it. I've read about the tribander Standard makes, and I'm not interested in it due to some problems mentioned in the QST review.

I'd like a tri-band rig with the features of the Alinco dual-bander (easy to use, few extra features I'll never use, rotating squelch knobs, to name a few). My main interest though is in how well it receives.
I don't want something torn up by intermod all the time. And I couldn't care less about how many scanner frequencies it can get--I've got a scanner at home. In fact, I'd prefer a rig that only had ham freqs., if that would reduce chances for
out-of-band signals crashing into my desired receive! Size also doesn't matter. I'm not getting something to be cute. I want something that works.

Any help would be appreciated. Any info on review articles on this or similar rigs would also be appreciated. I couldn't find any reviews by QST on it in the library.

Kent straight keys are the best you'll ever find, in my opinion. The
best machined, weighted and operating straight key I've ever seen.

I am cleaning the shack here, and have a couple of items to sell or trade.

Sell:

MFJ 204B Antenna Bridge, It is in their current catalog. Works fine, average condition, no manual. $80 new, sell for $35 shipped in 48

MFJ 949D 300 watt tuner with ant switch, 4:1 balun and built-in dummy load, has cross needle wattmeter, no manual, works fine, average condition. Front panel excellent, case has some scratches $47 shipped in 48

FOR SALE OR PREFER TRADE: My main QRP Radio Icom IC-735 w/250hz cw filter. In excellent condition. Has great QSK!! Currently set for 4-90 watts output. Have manual/mic/power cord. $600 Would like to work out a trade on a **NEW VERSION** Index Labs QRP++, or would consider a Sierra or OHR-400 in trade.

Thanks
Tim

1388. Ham radio gear for new operator

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-17 00:00:00 UTC
From: Michael Melland <badger@vbe.com>
Message-ID: <32DFEC26.1BBA@vbe.com>
Source record: 185874

I know that there are hundreds of opinions on this matter, but I am
wondering if those Hams viewing this list could share their favorite
recommendations for inexpensive gear for new operators.

Examples of possibilities are (not all inclusive):

Drake, TR-7
Kenwood TS-520 etc.....
Yaesu FT101 etc......
Drake TR4B-TX4B etc.....
And what accessories are recommended for them.....

I'd really appreciate any opinions or guidance !!

Thanks,

Michael Melland

Scott,

The FT50R was my first radio, at least amateur. I have access to many Motorola radios and I consider the FT50R the equal of any Motorola radio that I have used. I can't think of any dislikes at this time, be sure and get the software package, it makes programming the radio a breeze.

Please give my brother an offer for any and all of this collection of
Heathkit gear, all in good working condition, larger packages
preference...

GEAR LIST STARTS

LIST:
1 - Heathkit Model #SB-600
1 - Heathkit Model #SB-101
1 - Heathkit Model #HM-15 Reflected Power Meter
1 - Heathkit Model #HD-15 Hybrid Phone Patch
1 - Antenna Rotor motor & CDE control
1 - 6 arm antenna
1 - Microphone w/ button
1 - Microphone bulb w/o stand
1 - Gal RF load resistor
1 - Code Key
1 - 6 position coaxial switch
1 - Antenna rotor control model #T10 Alliance Mfg Co
1 - pair headphones by Sensiphone/Superex
1 -1 Home made cigarbox RF something w/transformer
3-4 loose vacuum tubes some are 4" & 5" tall
25+' RG59/U Coaxial cable
25+' RG58/U Coaxial cable
35+' RG8/U Coaxial cable
35+' RG8/U Coaxial cable
Misc short coaxial cables w/connectors
Other misc coils, switches & misc tube #6LQ6 USA.

1 - 1000 watt amplifier 22w x 15d x 28.5h, w/plate converter meter,
load
& plate adj. knobs, w/blower meter & switches. This unit is
very
heavy & has 6 large vacuum tubes: The top section contains 4 tubes
labeled RCA Electron Tubes #60-04. These are all connected at their
tops
as well as plugged in at their bottoms. There is 1 unused replacement
for
these labeled CETRON 5725/T160L, it is 2" dia x 6" high. The lower
section contains 2 tubes, 2-1/4" dia x 8" high. One is marked
JAN-CQN-872A, VT 42A, Made in USA, SLATER. The other is marked 872A,
USA
2-43, RCA Radiotron Electron Tube. Both have mercury spatters on the

inside of the glass.

1392. Yaesu FT-50R Speaker/Mic jack supply

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-17 00:00:00 UTC
From: Glenn_boozer@hp.com
Message-ID: <32dfe31c.93831130@hpscit.sc.hp.com>
Source record: 185878

Where can I get some male & female connectors that fit the 4-conductor speaker/microphone jack in th FT-50R?

My problem is that I have a Yaesu speaker/microphone that plugs into the HT and I want to have the audio go to a speaker in the truck and have the mic on the end of the cord still work.

I could wire this up if I had the parts.

1393. Ultimate Desense Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-17 00:00:00 UTC
From: creed@hiwaay.net
Message-ID: <32DF3DAD.2314@hiwaay.net>
Source record: 185879

A fellow ham owns a UHF 440 repeater operating on the standard + offset. The repeater is a modified Motorola Micor Mobile unit 50 W version. When the repeater first when up NO problems existed for example: Stand 50 miles away key up using low power on HT and was readable with out any problems. Then the repeater gradually has been getting worse with time. It now has major desense. It kerchunk drops due to desense and we know this because we monitor the input via phone and signal is o.k. with transmitter cut off. We have checked everything we know. Radio has been checked and is tune on both recieve and transmit frequencies. The 4 cavity duplexers have been checked both on bandpass and bandreject and they are fine. Changed antennas that didn't work. Changed controllers and that didnt work. Checked SWR and it was perfect. So with all this said it brings me to the questions. Could the 1/2" heliax be bad? Could it be the RF mixing in causing this problem? This particular site has no other 70cm in the shack, but does have several 2m repeaters includes 3 or 4 packet stations. The site also has a 220 machine. We thought it may be the coax coupling and sending signal down the outside of the coax but tried some ferrite beads and this didnt work either. However we weren't sure how many to try. Could it be lack of a good RF ground? Someone please give suggestions on how it may be possible to solve this problem. We are enthusiastic amateurs who want to maintain a good UHF repeater for fellow hams in the area. Your responses may help us in this endeavor. An equipment list is provided to show that we have tried to use only reliable equipment.
1)Motorola Micor UHF mobile modified into repeater
2)CAT-1000 controller
3)WACOM 4 cavity duplexor
4)Astron 30A Continuous PS
5)Andrew Heliax hardline 1/2" 100ft
6)Hustler G6440 base/repeater antenna

Thanks in advance,
KF4MMF

: a metal plate for mounting the radio panels. Does anyone have any idea where I
: might get something like this?

You might be interested in this then. I use a Garmin 45XL GPS in my pickup
and was searching for some mounting method. At a local store I found a
universal portable phone holder. It consists of two base units that either
1) screws into the floor, dash, or wherever or 2) slides into place over
the bolt holding the seat to the car. Into this screws a 2' gooseneck.
Onto this slides a spring-loaded holder that you put the GPS or HT or
whatever into and squeeze tight. The foam on the inside of the "gripper"
causes no damage to the unit. I've used it with the GPS, Yaesu FT51R HT,
Radio Shack HTX-202 HT. Release is by pushing a small button to release
the tension. That top "gripper" probably won't work for your needs, but
it would be easy to attach a flat plate in it's place. I don't remember
the brand name or anything, but it was called a universal portable phone
mount for your car. They also have one for CD players which might work
without anymods. I got mine at Shopko, for $36. I think you can find
them in auto parts stores as well.

Hope this helps somewhat. If you want more info, let me know and I'll
try to get it for you.

I for one am tired of being taxed twice on the same dollar. Once when I
earn it and a second time when
I spend it. Here in British Columbia I would have to pay 14% sales tax on
in province goods. I can get
away with 7% if I order out of province. On a $3000 item that's a savings
of $210.

I say screw the taxman. I can only earn a given dollar once. Why should I
be taxed on that same dollar
more than once?

Is there any way to change batteries and reload the RAM in the R71A
(other than shipping it back to ICOM)?

Nope, your $900 is a more typical price for what I acknowlege is a very
nice amp.

>band! =)
Actually, this is a nuisance even *in* band. I take my handi with me
when I drive out of town on business. I have three regular
destinations, each one has a separate set of repeaters along the
route. I have to lock in/out each set of repeaters one-by-one.
My point wasn't so much advocating using the FT50R as a scanner
(which I do, BTW) as that some of the features in scanner radios have
a place in ham radio design.

>>2. The radio uses a unique single pin plug for the extension

>accessories as the VX-10 commercial rig, so..

Hmmm...the local electronics store, and Radio Shack for that matter,
each stock about 50 different styles of plugs and connectors. All of
these cost less than $2. Couldn't the manufacturers at least choose
any one of the 50 for their designs? Hell no, they want to charge you
$10 or more for their plug. They go out of their way to find
non-standard plugs that they know you'll never find elsewhere.
Grrrrr.....

>>or off the air, but won't autostart - try recording a CW station ID,

>use any of the others..

I would like the one power button to cycle through all four settings.
You make contact with someone, they tell you you
aren't holding the repeater, you either have to go to high power and
drain your battery or take the time to reset the power. Seems like
an easy thing to fix.

>>7. The antenna sucks. Budget more dollars. It's an SMA socket,
>>so if you want to connect to coax or a BNC plug, you need another

>big guys with guns (secret service) so often not letting them know you
>are listening to them can be fun!

The nice thing is, I have a parka with a heavy collar. I can clip the
radio to my collar (I forgot to say, the belt clip is a good heavy
version that has a secure grip), which means I get the antenna up high
and I can hear well without the extension speaker. It's small enough
to sit there comfortably.

I am using a Kenwood TS-180S since 1982. It's an excellent rig,
especially for real FSK RTTY. The PA is solid state. Digital read out.
I upgraded it in 1985 for the WARC bands with the original Kenwood
kit. With my 1.8 Khz filter it's still a pretty good SSB rig as well.

Date: 1997-01-17 00:00:00 UTC
From: jbenson721@aol.com
Message-ID: <19970117220700.RAA00941@ladder01.news.aol.com>
Source record: 185908

Heard good reports on Ameritron and SGC HF mobile amplifiers. Some 20M QSOs mentioned "exceptional quality" of SGC PowerCube and the unit sounds good. However, its "microprocessor" technology sounds new and the extra bells/whistles maybe not as sturdy as a standard product.

Any comments on (1) Performance or (2) Reliability of these two HF amplifier units? Good/Bad/etc. Thanks much.

Best Regards,
Jim Benson N5ZAI

The equipment you list is fine for new amateurs - they generally run lower in initial prices. When buying used gear, there is the possibly that you don't get solid gear, but I have gotten my money's worth. Often if you talk to the seller, they will be honest and tell you of any quirks the unit might have. Soild state rigs with tube finals have proven to me to be very good choices. I have purchased three used rigs, and each time the seller gave me extra transmit tubes, manuals, and advice. Make sure you visit with a local radio club, and get an "ELMER". They will advise you well, and as I did, they told me of equipment that others in the area use, so you can look at potential equipment, then ask local amateurs about it. If you have more questions, send me an e-mail! I'll be glad to assist.

Hi Michael,

The rigs you've listed are fine gear, but...

I know some of my friends out there are going to disagree with me on this, but I'd re-think your list...it's almost all tube gear. I have some old tube stuff myself - that I dearly enjoy - but don't use for "everyday hamming" activities and wouldn't recommend for a newcomer to the hobby. There are some who would never use anything BUT their Drakes, Collins, Swans, old Kenwoods, etc...but it's just not for me - and I can only give you my opinions...

The old gear takes warm up time, most will not cover the warc bands without modification (the additional bands were not allocated to hams then), have analog tuning (not really a big deal), and some "drift" in frequency. Plus, tubes are quite expensive to replace (when you can find them), and (except in some instances) the receive in the older gear is not up to the standards of modern equipment. There are, of course, exceptions...but those rigs are almost as expensive to buy as a used modern solid state rig - and still have the other drawbacks...

For a newcomer, I would suggest you find a good, used, solid state digital rig with all the bands, "bells and whistles" (gotta have those! :-)), and I believe you'll be happier in the long run...

Okay guys - your turn...it's fair to yell, but don't throw things...

1435. anyone haveing fits with alinco dr-130

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-17 00:00:00 UTC
From: Bill Wright <wrwright@danville.net>
Message-ID: <01bc045e41742960d6fbc6cd@default>
Source record: 185921

Hi and just a quick question about the 130. I have had this radio back to alinco twice for the power dropping. They fixed the pin diodes the first time, at least that is what was on the repair slip, and the 2nd time they put a new power module in, by what the repair slip said again. Well after it was of warranty it again quit. Have there been that many of these radios doing this? Also cured mine by finding a bad trace in the power module. I think Alinco ought to find a way to cure this not me but that ain't what they think. Thanks for reading Bill Wright ka9dsa

> unfamiliar with this band. Can I use a vertical for both local
> repeaters and skip?

Yes
Is 10 watts sufficient for most work?

Its sufficient for a lot of it.

What time of
> the year is the long haul season?

Sporadic E is best in May thru July with a secondary peak in December.
It can happen anytime.

Which polarization, vertical or
> horizontal.

FM work is mostly vertical. SSB/CW is mostly horizontal. On skip
signals it doesn't matter much.

Is that Crushcraft 3 element yagi a good one?

Its as good as any other 3-el beam.

Can I work
> the skip on a vertical?

Sure.

Any comments would help immensely. Thanks,
>
> Bob... KN6GA

You're welcome. Clair, K0CJ

Yup, there is a mod available that not only lets you change the battery
yourself but increases the number of memroies without any drilling or
other dis-figuring stuff. I am sure that it is on the net. Try
R-71A;mods etc.

Dear Hams,

I own a UHF Hand Held ICOM IC-T42A which covers 440 to 450MHz.
Being in Europe I would like to extend the TX coverage to
430-450Mhz and enable the 1750Hz tone burst.

Who has mods for this radio ?

Thank you so much in advance.

73, Daniel.

From: Les Wilson <nessman@servtech.com>
Message-ID: <32E16229.4D7F@servtech.com>
Source record: 185742

Could someone help me with a problem with this radio. I need to know how to reset the CPU on this radio. The programming in the radio somehow got messed up and I can no longer reprogram this radio via the keyboard -- I can access the programming mode, but it will no longer accept my entries.

Any help would be grateful. I don't want to put this radio in the shop for a decade or two for a minor problem.

Someone had suggested that I hold down the shift+# keys while turning the radio on. No dice.

Please reply via e-mail as I do not check the newsgroups very often.

Thanks!

1462. TS830 VFO Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-18 00:00:00 UTC
From: wormser@osiris.cso.uiuc.edu
Message-ID: <853631424.16371@dejanews.com>
Source record: 185759

Kenwood TS-830 VFO Stability Problem
I have a frustrating problem with my TS-830. Does anyone have any ideas to offer me? I am not the world's greatest troubleshooter, but I hope to improve in that area. (The rig's VFO module and I are becoming old friends).
THE PROBLEM:
The VFO jumps 100 to 200 hz up & down.
OTHER OBSERVATIONS:
The serial number is 4070093 (Is this a high number? does the "407xxxx" mean it was the 93rd one built in July 1984?)
The problem occurs most of the time, but "went away" for a few day each when I did each of two fixes (see below).
FIXES TRIED:
1. Grounded AVQ/AF board as per Service Bull 820R & QST Mar'84
2. Cleaned wiper on main tunign cap of VFO
3. Tightened MODE switch to chassis
FURTHER OBSERVATIONS:
VFO doesn't drift, but rather jumps around a center frequency
Jump is same size on all bands
VFO is stable for 30 sec to 1 min after turning the plate voltage safety switch off-then-on (this is a safety switch used when neutralizing the final tubes).

By the way....I can tell you which one I would choose, because I had
both of them staring me in the face a while back and I chose the '1000D.
My feeling was that while the 'MP is a good value, it is based on one
principle-------- for some, bells and whistles rule above all else. I
don't have a problem with that. I think they're neat, too!

But thank you anyway for your commentary, Steve. It is nice to know that
you are patrolling the newsgroups, looking for "price violations" and
pointing them out. What would we possibly do with out you and your
MASSIVE intellect???

Message-ID: <1997Jan18.190147.2@bbs.ug.eds.com>
Source record: 185773

I may have found a 'hidden' feature on my new TM-V7A. Kenwood advertises and documents that you can store four configurations.

You can actually store a fifth using <F><PM><VFO>. Although this will not store the VFO frequencies (unfortunately), it will store all the display settings (such as reverse, S-Meter, etc.) :-).

From: Rhiannon@diac.com
Message-ID: <5brk4u$ahm@doom>
Source record: 185775

Potter & Brumfield circuit breakers for small electronic equipment use, #W58XB1A4A1 (1 Amp), originally purchased from Newark Electronics (#56F870) and cost $10.07 each in single quantity and $7.64 each in 99 quantity.

They're the type almost everyone's seen at one time or other; brown with 1/4" quick connects in back & a white reset button in front with the ⊡1⊡ on it. There are 480 of these new in the original shipping carton! Perfect for building into some new equipment! Want to sell the whole box together. Make me an offer for all! $4 each for all?

I have picked up the RTTY kit and am dusting off the old SWR with a bfo, to try my luck.... Now I see on the RAMSEY homepage that direct satellite images can be found in the 170MHZ range, however the $300 kit is way outta my league....

Antennas can be built, but certainly there is more to these 170MHZ receivers then a rat-shack weather-cube... Whots the deal? Channels? sideband, what?

OR... anyone have something like the ramsey kit they got Bored with for a more reasonable price?????

cheers... B/H.

Frank:

I'll bet you could get a fair technical comparison through Yaesu. I don't think that the 'MP is a "pricing mistake".....the FT-1000D is still supposed to be the better technology with better receiver performance in several areas. I know they have a web site at http://www.yaesu.com but I'm not sure you will be able to get info via E-mail. You may need to call them in CA.

Hi,

Can anyone supply the protocol for remotely controlling the Kenwood TM621 / 721 transceivers? Kenwood sold the RC10 remote control, which connects to the 8-pin mic plug and (I assume) controls the radio via serial data on one or more of the mic plug pins. I'd like to build my own remote control.

Any help would be appreciated.

Thanks,
Bob N3HAT

From: "Michael A. Fallavollita, Ph.D." <mikef@microtech.com>
Message-ID: <32E1CF78.3508@microtech.com>
Source record: 185785

I'm in the market for my first HF rig and I'm looking for an older solid-state radio for the least amount of money. (Just out of school and need to pay off my student loans.) I really don't have any solid information on any of these radios (TS-130, TS-140, TS-440, Icom 735, FT-77, FT-757 ... I've recently seen a Yaesu FT-77 for sale but I don't know the first thing about this radio. Can anyone give me any information or recommendations? A general coverage receiver is a definite must, as is the ability to modify the radio for the Marine SSB band (in case of emergency).

I'll appreciate any responses, especially those that can give some solid pros/cons for any rig that can be had for less than $500.

Hello...

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside the software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Be fore warned! A registered copy costs US$ 25, but after all, registered promotes the further development of this and other software while giving you the right to acquire all future versions paying only for delivery

expenses, if any.

Fianlly, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

Should work, make sure you habe the transceive function enabled in the
intial set mode of the 736. Transceive sends data out the CI-V port when
you tune the radio or change modes.

It is likely the zebra strip that the display uses to connect to the ligic
board is mis aligned or defective. You might try cleanng the contact area
where the zebra strip touchs the logic board with a pencil erasure, then
clean using a cotton swap and rubbing alcohol.

>
If I remember correctly the Midland 70-154 is an ICOM H-16 made to
Midland's specifications by ICOM, Inc Osaka, Japan.
The Midland 70-154 as the H-16 do not have a reset function. You need to
clone each radio. Now Midland required the use of an external cloning
device where the ICOM can use another good working H-16 radio. Midland had
ICOM remove the radio to radio cloning ability in their 70-154. DO NOT
remove the lithium battery as you will THEN have to clone the radio as
there is no recovery method otherwise. Midland also had a 70-254 UHF
version cousin to the ICOM U-16 radio. ICOM does not support the 70-154 or
70-254 in any way, there are Midland radios for all concerned.

$$$$ This is what many people call A $$ scam but, IT WORKS you can't lose!!!!!!$$$$

Take five minutes to read this and it WILL change your life.

The Internet has grown tremendously. It doubles in size every 4 months. think about it. You see those 'Make.Money.Fast' posts more and more. That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, whats $5.00!
So I sent in my money and posted.Everyone was calling it a scam, but there are SO many new users!

Well, two weeks later, I began recieving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, the By the end of the fourth week, I had recieved nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking this serious.

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill inside each paper, and mail them to the folowing adresses:

1-M Palmer Gilfach Goch,Blaenpenal,Aberystwyth
SY23 4TN ,United Kingdom

2-T.Toole box1138,Valemount B.C
Canada VOE-2ZO

3-Vitor Schlrder de Borba
Av Lucas de olivieira 2280 ap 404
90460-000 Porto Alegre/RS Brasil

4-Evert jan Benz
nijensteinheerd 58
9736 TD Groningen
Netherlands

5-J.J. Alles
RR 2 Site 81 Comp 6
Smithers, B.C.
V0J 2N0
Canada

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 250 newsgroups. There are at
least 19000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can. Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the Internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250
additional postings with your name at #4, 1000 postings. On
average then, 50 people will send you $1.00 with your name at
#4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your
name at #3 or 10,000 postings. Average return, 500 people= $500.
They make 250 postings each with your name at #2= 100,000
postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at
#1 and you get a return of $60,000 before your name drops off
the list.And that's only if everyone down the line makes only 250
postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list,
you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through
and repost this article everywhere you can think of.
The more postings you make, the more cash ends up in
your mailbox. It's too easy and too cheap to pass up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it
works. There are millions of people surfing the net every day, all
day, all over the world. And 100,000 new people get on the net
every day. You know that, you've seen the stories in the paper.
So, my friend, read and follow the simple instructions and play
fair. Thats the key, and thats all there is to it. Print this out
right now so you can refer back to this article easily. Try to keep
an eye on all the postings you made to make sure everyone is
playing fairly. You know where your name should be.

If you're really not sure or still think this can't be
for real, then don't do it. But please print this article and pass
it along to someone you know who really needs the bucks, and see
what happens.
I've been perusing usenet for a few months now and I've seen these ads
appear very often. Like you, I thought that these postings were a
complete annoyance and a waste of time. But after reading dozens of them, I
decide 'For the sake of only 5 dollars I'll give it a try'. But the
reality is that it DOES work and you are guaranteed to receive large
sums of money, legally.
Make sure that you put your correct mailing address,
especially if you're from another country as some people have never sent
mail out of the country and might not know how. You may alter this
article
if necessary, editing what you need to edit.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS!
GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages
with your name in the list and not sending the bucks to the people
already included, you will not get much. I know someone who did this
and only got about $150 (and that's after two months). Then he sent
the 5 bills, people added him to their lists, and in 4-5 weeks he had
over $10,000!

TRY IT AND YOU'LL BE HAPPY!!! :o) !!!!!!!!!!

INSTRUCTIONS ON HOW TO POST USING NETSCAPE 3.0

1. Click on any newsgroup like you usually would, then click on
"TO:NEWS" in upper right hand corner. This will bring up a message box
to type this article in.

2. Leave the message box like it is, don't maximize it. In Subject
box type something flashy like "$$$CASH READ HERE$$$".

3. Tab once and you are ready to type in the body of the box. Retype this article but with your name inserted in slot #5 and the others moved up as I directed. Remember the #1 in this article will be removed in yours.

S. Pypke tells people to retype the article. This may not be necessary. Try this: highlight the article with a mouse (or click edit and click select all). Then, click edit, click copy. Then, go to notepad, or Word, or WordPad, or Wordperfect. Click paste. Save it from there. To post, highlight from notepad. Click copy. Go to the mail section to post, click paste. Go on from there. This will make it easier.

4. When you are done retyping this whole article with the proper changes, click on FILE in this message box (it is right above SEND). Click on SAVE AS under FILE (make sure your in the newsgroup message window, not where it says Netscape News) Save your file as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS!!! Once saved move to next step.

5. To post to at least 200 newsgroups do the following. You can post to more which will bring you more money but 200 is the bare minimum. Go to a newsgroup you want to post in. Click on "TO NEWS". Write your subject just like you did when you retypd this article. Hit tab once. Now click ATTACHMENT.
Another box comes up. Find your file where you saved it. Highlight the file and click "OPEN". Now click OK. If you did this right you should see the file name in the Attachments box in shaded letters.

6. NOW JUST CLICK SEND. Do this to at least 200 newsgroups (there are over 18,000) Each time it takes no more than 30 seconds so once you have retyped the article its easy.

INSRTRUCTIONS FOR EXPLORER

1. Holding down the left mouse button, highlight this article. Then press "CRTL" key and "C" at same time to copy this article.

2. Print this article for reference.

3. Go to Newsgroups and press "POST AN ARTICLE", a window will open. Type your headline in the subject area and click in the large window below.

4. Press "CRTL" and "V" and the article will be placed in the window. If you want to edit the article, do so and then highlight and copy it again. Now every time you want to post the article in a new newsgroup just do the "CRTL" and "V" command and press Post"

Does this birdie still exist with the antenna disconected? At my
location low level carriers are receivable with the antenna connected
from CATV leaks and from this computer. With the antenna disconnected
the receiver is reasonably quiet. I'm using an HTX-212.

On 146.760 with an external antenna just now I get no S-meter reading;
however, with a short wire I get S7 from, I think, this computer.

1500. Alinco DR-110

Newsgroup: rec.radio.amateur.equipment

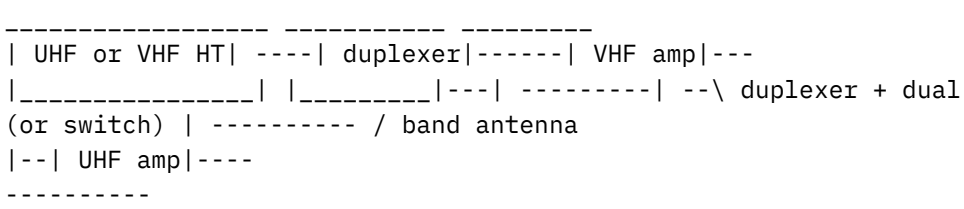
1501. reverse use of duplexer

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-18 00:00:00 UTC
From: jabrams@hoflink.com
Message-ID: <Pine.BSI.3.95.970118010620.20159E-100000@hoflink.com>
Source record: 185798

Can a duplexer (dual band 144/450) be used to split a transmitted signal from either a VHF or UHF radio in a converta-com unit to either a VHF or UHF RF amp., or am I better off getting an inexpensive manual antenna switch to do the job?



1502. Need Astron Power Supply WebSite or Email Address

I have an old MAC bug from the 30s -- it used to be silver plated
and probably very beautiful -- now the plating seems to have all
worn off. Does anyone rehab these things to make them look like
they once did? If so, please forward info. Thanks

1504. Re: 2M KLM Amp PA15-160BL Help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-18 00:00:00 UTC
From: ad7k@accessnv.com
Message-ID: <32e070d1.2876264@news.accessnv.com>
Source record: 185801

On Mon, 13 Jan 1997 12:08:14 -0800, scott <acepilot@mwt.net> wrote:

>A friend has a KLM 2M amplifier with a model number of PA 15-160BL and
>would like general specs on it. I figure it is designed for 15 Watts
>input and 160 Watts output. Anybody know for sure?
-->snip<--

The PA15-160BL was designed for a nominal input of 10 Watts (maximum
15, hence the "15" in the nomenclature), and 160 Watts out when driven
with the "nominal" drive. The "B" in the nomenclature indicates that
it was built for the two meter band (A=6, B=2, C=220, D=440), and the
"L" indicates that it was (somewhat) linearized for SSB use.

This amp was produced by the original KLM, starting production in
approximately 1976-77 or so, which ended when one of the original
partners in KLM departed to form Mirage Amplifiers in approximately
1978. KLM and Mirage later merged, under new common ownership, and
operated as separate divisions of the same company, co-located in
Morgan Hill, CA. This company was acquired by another individual, in
approximately the mid-1980's, who later retired, divested himself of
the two divisions, with the amplifier section (Mirage) being sold to
MFJ (who runs it as a separate division within their corporate
structure - other similar divisions are Vectronics and Ameritron), and
the KLM Antenna section going to a husband and wife team in Washington
State.
The chances of getting manufacturer support, after all those changes,
are slim to none, but I certainly wish you luck - if you do not have
the original schematics, perhaps someone can come up with one ... if
needed, contact "HI Manuals" in Council Bluffs, Iowa (which is the
remainder of Leo Meyerson's "World Radio Labs", which had a
manufacturing arm called "Galaxy Electronics" - but that's a whole
'nother story) (and don't confuse the old Galaxy Electronics with the
present Galaxy which imports a grey-market CB radio disguised as an
Amateur 10 Meter radio).
Good luck and very 73,

1506. FS: 37' Telescoping Mast

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-18 00:00:00 UTC
From: gvs@netcom.com
Message-ID: <32e07ee7.19713626@192.0.2.3>
Source record: 185803
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.misc

Telescoping Mast for sale
in San Jose, CA.

37 foot Telescoping Mast, material is schedule 80 PVC Tubing,
in 4 sections, with O.D's: 3.50", 2.75", 2.25", and 1.75". The
sections are held in place by a u-clamp and thru center eye-bolt
arrangement. Each u-clamp has 2 outer eye-bolts, along with the thru
center eye-bolt, which are used as guy points.

The bottom 3 sections use PVC sched 80 reduction union joints (very
beefy) which I reamed out to allow upper sections to slide thru
freely. The three over-lapping sections are over lapped by 12, 16,
and 18 inches, from smallest to largest dia., respectively. Each
upper section has 2 sets of 3 spacer bearings that take up the
excess play inside each over-lapping section.

As you may well have gathered, I have an Engineering background
and took some time designing this Telescoping Mast. It wasn't
something I just threw together.

The last 2 years in San Jose, CA, has brought storms with winds as
high as 75 mph. This Mast barely moved during these storms. Also, I
use three sets of guys which are marine-type nylon rope that is UV
resistant.

Mast is more durable and can withstand higher wind speeds than
a steel mast, when guyed properly. Also, Mast doesn't interact
with antenna like a steel mast would.

73,
-gary

Beautiful Collins KWM-2A (winged) and PS-2 power supply for???

I'm interested in other Collins gear especially 30L-1 amp,
62S-1 transverter, older AM gear, microphones, S-Line ascessories...

VHF and UHF transverters that can be made to work with the Icom 775.

High power VHF or UHF amps (500+ watts)

Any really 'interesting' ham gear. (no packet stuff please)

I prefer a local swap in the SF Bay area and will consider a cash
sale only if I can't find any interesting trades.

Unit is not for sale or trade to exporters.

Peace;

Kim

Hi All:
I wanted to let you know about something I found on the World Wide =
Web.
A service called Mailzone.
Mailzone is an E-mail forwarding service that will let you try it for =
30 days after that there is a one time $10 set up charge. You change =
your E-mail address to for example macmike@mailzone.com. This way no =
matter how many times you change primary service providers your mail =
is always forwarded to you. Let's say your provider now raises costs =
or quits offering the free 800 number access if you had been using =
mailzone.com nothing would change all you would have to do is notify =
mailzone and your forwarding would be changed. Let's say you move to =
a new area no E-mail yet. fine let mailzone know and they hold your =
mail until you get a new provider let them know and your mail then =
comes to you. I have signed up. Here is a copy of there Welcome to =
Mailzone HTML for you to see further information.
Keep in mind I get no money from this. I think it is a fantastic =
idea. Just think if all the juno people had had this I wouldn't have =
had to do all the subscribing and unsubscribing of addresses.

Why use MailZone for your E-Mail address?
Home
In today's dynamic market, most people have already
Company Profile switched their Internet Service Provider (ISP) at =
least

The best tech on the 551D I am aware of is Malcom Technical Support at
509-732-8883 or fax him at 509-732-8884. he is a former ICOM America
employee and the old radios are his bag. Even ICOM is using him for some
old radio repairs these days.

Quite the contrary...
there are about 25cities with 1.9GHz all-digital systems, and about 20
with upgraded digital/analog 800 MHz systems (some channels are dig.others
analog).
We also have six cities with the MIRS(Motorola) mixed telephone/dispatch
system by Nextel.
The systems are either TDMA (Generally GSM standard but on 1.9 Mhz or 800
MHz) , or CDMA (both bands also)

How high data rates would be possible using unmodified voice grade
FM-radios on non-fading VHF/UHF paths between fixed stations ?

Is the audio really that bad compared to ordinary telephone lines,
where speeds over 30 kbit/s are possible. Yes, I know, the telephone
is full duplex and you can train the equalizer at the beginning of the
connection. Training the equalizer in packet radio is problematic, if
there are more than two stations on the frequency.

How about training the equalizer when the connection attempt is made.
During the handshake period, the stations could even agree what speed
to use. The equalizer coefficients would then be saved and the
equalizer would be reset to default settings. When the station sends a
packet, the first bytes would be transmitted at a low speed (say,
using standard AX.25 header at 1200 bit/s FSK). All stations could
copy these bytes with default equalizer settings. Based on the source
field (callsign) in the received header, each station would check if
it has equalizer settings for this station and modify the equalizer
accordingly. This would be faster than train the equalizer in each
transmitted with a long preamble. Of course, you still have to retrain
the equalizer if there are changes in the propagation path.

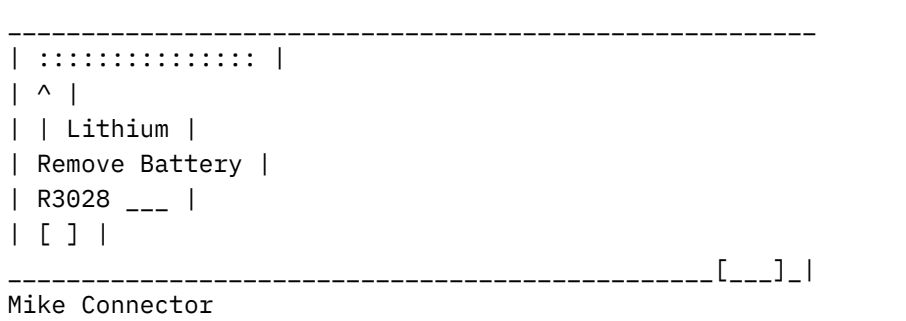
Not familiar with the 901 or 840. I have heard that there were some
problems with the 901. I do know the 757 and would reccomend it as a
great little starter rig. Small in size, 100 watts, general coverage
recieve and just a great little radio. I see them posted for anywhere
from $400-$500. Good luck,
73s.....LT

1528. Mod: Yaesu FT-8000R Expanded TX Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-18 00:00:00 UTC
From: David Johanson <johanson@sprintmail.com>
Message-ID: <32E11270.3ED0@sprintmail.com>
Source record: 185825
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

The FT-8000R Expanded TX Mod

Behind the front panel (LCD Display) of the radio were the
Lithium battery is soldered. You will see a PC board similar
to the one below. There is a row of 15 jumpers. There is a
larger component on the 4th and 6th position from the left.
If you remove the component at the 6th from the left position
and reset the radio you will have expanded TX. This does not
open the cellular block on the radio. It may be controlled by
one of the other jumper locations on this row of 15.



For educational use only! Do not transmit outside the
Amateur Bands! I am not responsible if you damage your radio.

Please send any updates/changes to: johanson@sprintmail.com

Source record: 185829

DRSI PCPA1 and M-2400 BPS modem along with 2 DCD boards..
This TNC is more suited for sysops althou it has software
to run as a TNC program..

This TNC and modem will allow running 2 ports on one com port.
Set it for 1 - 1200 and 1 - 2400 BPS on one radio enabling
it to do both at the same time on one freq or,
You can use it for two separate radios, 1 -1200 and 1 - 2400
Also comes with 2 DCD boards , allowing it to also run open squelch..

The cost of this equipment runs as follows

PCPA1 -- 149.95
M-2400 149.95
2 DCD boards 70.00

369.90

Make an offer or if you have an HT you want to trade off??

> Michael Melland

Michael:

First, I agree with the other person who responded, avoid "hollow state" (tube) gear. That leaves out 3 of the 4 rigs you mentioned. I won't repeat the reasoning in the other post, it was quite sound.

Re: The Drake TR-7 (circa 1978) was way ahead of its time. It does have an excellent receiver which will perform as well as a recent low-end rig. Make sure you have (or add) the 1.8khz SSB filter--it really is essential on today's crowded bands, and make sure the rig you buy has had the WARC bands enabled, either by opening up the rig to general coverage transcieve (there was a trace you cut on the main board), or by the installation of the AUX-7 board. Otherwise, just make sure it's in good condition and working well. This is one rig you will enjoy. It is also the only rig you mentioned that has a general coverage receiver. Listening to short wave is fun too! The rig will sound better on strong AM signals if you have the 6khz AM filter, or install a 1k-ohm resistor across the points where you normally install the filter, which will disable the existing filter and "open up" the rig's receiver when the AM filter position is switched in.

Other options to consider in similarly priced used rigs:

Kenwood: TS-430S, TS-130S
Icom: IC-740, IC-725, IC-730, IC-720A

Yaesu: FT-757GX, FT-77, FT-707
Ten-Tec: Delta, Omni-C, Omni-D
Drake: TR-5
NCG: 10/160 (probably more money)

All of the above have the WARC bands, except for the OMNI-D, which can have the bands added. The NCG, TS-430, IC-725, and FT-757GX are general coverage. By the way, I own a fully loaded IC-740, and no, it's not for sale. I did own a TR-7, and probably shouldn't have sold it, either.

73 & good luck!
Martin

Hamfest - Sunday February 16, 1997
Sponsored by - The Long Island Mobile Amateur Radio Club
Where - New York State Armory, 63 Babylon Turnpike, Freeport, New York
Time - 9:00 - 2:00 (doors open at 7:00 am for sellers)
Admission - $25.00 / 6 ft table (LIMARC Supplied): $ 6.00 General Admission All others

If you are interested in selling at the Hamfest, you MUST reserve you table(s) in advance. Please note tables will not be sold the day of the Hamfest. Currently we have sold approximately 60% of the 100 + tables, so please do hesitate to reserve your space now.

Make your check out to LIMARC and mail it to Mark Nadel, W2OT, 22 Springtime Lane East, Levittown, New York 11756-4419.

For any additional details on the Hamfest call the LIMARC information line at 516-520-9311 any time 24 hrs/day.

There will NOT be any amateur radio exams given at the Hamfest.

Directions:

1. Take the Northern State Parkway, Southern State Parkway or Hempstead Turnpike to the Meadow brook State Parkway South to Exit M 7 west, Babylon Turnpike. You will see the
New York State Armory on you left side as you exit onto Babylon Turnpike.

2. From Sunrise Highway you can pickup the Meadow brook Parkway Noth the exit M7 west, Babylon turnpike to the Armory just on your left side as your exit onto Babylon Turnpike
west.

3. If you are Coming from any of the following bridges: Throgs Neck, White stone or George Washington follow signs to Long Island Via the Grand Central Parkway to The Northern State and follow above instructions from paragraph 1.

If you are coming from the Verrizano Bridge, take the belt parkway, to Long Island to The Southern State parkway and following the above directions in paragraph 1.

Door Open at 7:00 am for sellers and 9:00 am for the general public.

Michael:

I'm sure you are starting a thread that will develop, and
you should get lots of good opinions. Having owned all
the rigs on your list, and with 33 years as a ham, I am
perhaps as qualified as any to offer an opinion.

There are many factors involved in selecting a "first" rig.
Assuming the monetary pressure is not there, but the
budget does have limits, the best choice is a transceiver.
As a newcomer, you won't be able to "appreciate" the
extra performance that having the transmitter and receiver
separate will give you, and the cost will be considerably
higher.

The modern transceivers provide more convenience
features (this is debatable!), but not significantly more
performance than the older transceivers. However, from
a reliability standpoint, buy new if you can. Stick with a
"classic", if you are going to buy older. If you want the
"new" WARC bands, check to make sure the rig includes
them, especially if it was manufactured prior to 1980.

If you plan to operate CW, insist on a CW filter as "standard"
equipment.

Of course, if you can, try out different rigs personally. That's
absolutely the best way to size them up to see if they fit you
individually.

My personal suggestion to you is to start with a classic old
rig in the best condition you can find. You mentioned the
TR-7, TS-520 and the FT-101. These are excellent choices.
I think you'll find that you'll like them so much that you'll want
to keep them when you upgrade to more modern equipment.
If not, there will always be a demand for them should you
decide to sell. In either case, you'll be satisfied with your
investment - the sign of a wise decision.

:>My mla2500 roadmap says these 5 caps have a rating of 500v. I don't know
:>of any source of 500v electrolytics.

The MLA-2500 has had several values of filter capacitors over time.

My original schematic shows the six (6) power supply filter capacitors
as
150 uF at 450 Volts. At some time there was a note in the parts list
changing the capacitor values to 100 uF at 500 volts. My spare parts
stock contains a couple of Mallory FP-155, 125 uF at 450 volt
capacitors,
that were left over from a "minimum quantity" purchase when I had to
replace the caps several years ago.

In any case, since the MLA-2500 uses a voltage doubler power supply, any
redesigned filter band will require an EVEN number of capacitors ... six
or eight, not five or seven.

Funny My 989-C works just fine up to 600W (the first one arrived via
UPS and before I could use I had to reset the wafer switch cam and the
inductor was unuseable - the second one was fine). On the other hand,
my MFJ TNC was without doubt the most frustrating peice of junk I have
ever used. I had to repair it 6 or 7 times. The last time I stayed up
almost all night and only got another month or so out of the beast.
I think buying MFJ is kinda of like a dice roll. Sometimes you win and
a lot of times you lose.

>(e.g. G3RUH modem, AFSK modem), but when it comes to developing really
>new things the progress is much, much slower.

That's true, but what we're talking about here should accomplish some
useful things. Because it *doesn't* require an investment in special
one of a kind hardware, participation should be larger than for things
like the TAPR DSP card. The more people playing, the greater likelihood
that some of them will have real expertise (that's just simple population
statistics). Also, because special development tools aren't required for
hardware debugging, and because the base C++ compiler can be used for most
algorithms, learning how to do DSP programming should be easier, so more
people will gain the expertise that you (correctly) see as so lacking now.

>Besides, we are trying to speedup packet beyond the point that is
>reachable with commonly available DSPs and audio codecs, and thus it
>will be even more difficult to be at the leading edge with DSP modems.

The hardware base suggested is sufficient to achieve markedly better
performance than most available hardware solutions for *voice grade
radio* use, and likely better than some dedicated platform DSP solutions.
Speeding packet up beyond that requires special RF hardware, and in some
cases, requires regulatory relief. That's a worthwhile direction to go,
but it isn't the only direction where cutting edge improvements can be
made.

This shouldn't be looked upon as a method to achieve higher UHF+ packet
speed. This is intended to improve average performance in the low to very
low speed arenas, especially for weak and noisy signals, IE satellite, HF,

etc. The hardware base presented is sufficient to offer good opportunities in that area. Also, more mundanely, it can replace several hardware modems for the up to 9600 baud voice grade operations amateurs currently pursue. There is room to push the envelope at both ends of the speed spectrum. This approach is for the lower end of that spectrum.

>The medium-speed packet radio modems that are now popular (DSY 56kbps
>modems in the States, speeded-up G3RUH FSK modems in Europe) are not
>based on DSP technology (better: not based on general-purpose DSP with
>custom software that could be modified for further improvement).

That's true. GP DSP hardware isn't up to that task on an amateur budget yet. It is still more cost effective to retain simpler modulations and codings using dedicated RF hardware. That will certainly change over time, but it is the wrong place to introduce large numbers of amateurs to the art of DSP coding because it *does* require specialized RF hardware. Fortunately, in the UHF+ spectrum where higher speeds are permitted, good non-fading SNRs are relatively the rule rather than the exception, and spectrum is relatively uncrowded so spectrally efficient modulations aren't so vital. Thus DSP is not needed nearly so much there as it is at lower frequencies and lower speeds where voice grade radios and audio rate coding can provide benefits.

The approach outlined uses totally *off the shelf* hardware, and that's important for several reasons. First, it doesn't add distraction and confusion to those attempting to concentrate on DSP coding improvements. It requires no exotic RF test gear. And it allows lots of people to participate without making a large investment in special purpose hardware which cannot be used for something else if they find DSP work not to their liking. This latter has restricted participation in many projects which required the purchase of specialized hardware. For example, I have what may be the only fully functional TAPR NNC in existence. Only a few people were willing to purchase the dedicated hardware, and fewer still were willing to do serious code development for it. Thus it died on the vine, even though for its era it offered lots of potential. TAPR's dedicated DSP card faces a similar fate.

FS: Icom 775DSP and AT-100

I ship, or you can meet me at the Miami, Ham Fest on 1st and 2nd of Feb 1997.

No COD's, Send Certified Check or Money Order, since I hear on the news groups people have problems receiving the COD and that a bad personnel check could be used for payment.

FS: Icom 100 watt - AT-100 Antenna Tuner $225.00

Icom AT-100 matching external automatic antenna tuner for Icom radios, with 4 automatic switching coax antenna connections. Comes with the standard control cable that connects to the back of an Icom Radio, An optional OPC-118 Cable is required for the 725,726, 735, 761, 781 and others refer to the transceiver instruction manual. It operates on AC or DC. $225.00.

The unit in very good condition, operates perfect with the manual, however I don't have the
Original box.

IC-775DSP: $3,500.00

The radio is in New/Mint condition no smoking and always covered, All 5 filters installed, plus the crystal oven. All Original and no modifications done. Original Box and Manual.

Reason for selling; use very little and more radio than I need.

Radio can be seen at: http://icomamerica.com/amateur/hf/

Specs. Below from the Icom page.

Pull Out Those Weak Signals with ICOM IF-DSP!

Dimensions: 16.7 (W) x 5.9 (H) x 15.4 (D), 36.8 LB
DSP (Digital Signal Processing) TX/RX
200 W Stable Output Power (SSB/AM/FM/XCW/RTTY)
Built-in Heavy Duty Power Supply
Fully Adjustable DSP Noise Reduction
Level/Width Variable Noise Blanker
PSN Modulation
Audio Peak Filter
Dual Watch (2 Receivers)
Dual Tuning Knobs
Twin Pass Band Tuning
Power MOS FET PA Section

Electronic Keyer
Memory Keyer
CW Pitch Control
CW Reverse
Two Key Jacks
Large, Easy-to-Read Display with Amber Background

Michael:

Here are my opinions:

1. Had a Yaesu ft-101EE in the late 70's. Great radio for about $300. Just make sure to test it out thoroughly before you buy it.

2. Used several Kenwood 520s. Like them, too.

3. You might consider an all solid state used rig like the Kenwood 120, or 140,

Don't know about the Drakes, but lots of people are still using them.

Good luck with your decision.

>Paul OH3LWR

You've identified the problem, Paul. And your solution is probably
the only one practical in a contention environment. But it just won't
do. The low speed overhead on every packet, coupled with TR turnaround
delays, simply overwhelm the throughput advantage you get from training.
If we want telco-like throughput on voice grade radio circuits, then

we're going to have to nail up non-contending duplex links to get it.
Now that's certainly possible, but it would be a coordination nightmare
on the popular VHF+ bands.

Gary

Hello All... Was at a friends house and saw a beam heading thing on his
wall...
It is a Great Circle map centered on his QTH with a slew of LED's around
the
"world". When he points his beam,these led's move to indicate where his
beam is pointing..really cool...Anyway,anyone hear of such a thing and
where I might start
looking? He thought it came from VECTRONIX but didnt rememeber...
Maybe you even have one?
Thanks much...

1568. Re: TS530sp CW output power

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-19 00:00:00 UTC
From: Joe BV/N0IAT <joentam@transend.com.tw>
Message-ID: <32E17571.4D8D@transend.com.tw>
Source record: 185606

Dave,
I believe this can be done by simply lowering the carrier control.
If I recall, the procedure is to tune the PA at full power, then,
once "tuned up", simply lower the carrier control to reduce CW
output.

As an aside, the old TS520/820 offered a modification that would
disable one of the two S2001 tubes (6146B's) to allow maximum 75
watts input. I believe this approach may also be taken on the
530/830 series.

Check the kenwood service bulletins for info at
http://www.kenwood.net

73,
Joe

Actually, the freeband mod consists of pressing the knob and lamp buttons
while turning on the radio, then selecting "Freeband" from the menu by
turning the knob.

Other mods require desoldering, etc.

1570. FT-50 and KPC-3 TNC problems

Message-ID: <19970119061200.BAA12965@ladder01.news.aol.com>
Source record: 185608

I am attempting to hookup a KPC-3 Terminal Node Controller to my FT-50R.

I have been trying the ADMS cable to connect the radio to the TNC, no response.

Without the radio, the KPC-3 software dosen't seem to want to run under Win95 (only supports COM 1 & 2, I have to use COM3 on my laptop) and I tried many diffrent setups on Hyperterminal in Win95, still no dice.

Bonus question for Fairfax Co., VA HAMS: is the data noise on the police freq's readable with this setup or is there an encription sceme?

Thanks in advance
Master of all things having no apparent use.

Amateur radios aren't intended to be out of band scanners. They are
just recently being made to go out of band. The early amateur radios
would do 144-148, not a MHz higher or lower. A friend has a old HT
with dials on the top to program the freq. has 3 dials: the 1 is
branded in, then has a dial for 4,5,6,7 or 8, then a dial with
1,2,3....0, then a 25, 50, 75, 00 switch. An amateur radios main
function is an amateur radio, not a scanner. And by out of band, I
meant cell phones. YOU grow up, and use your head.

I've had my 761 for 10 years and it works great. So great in fact that I've not been interested in getting a newer rig. It can be modified to transmit all frequencies easily. I've had to send mine back to ICOM twice for service--nothing major. The ARRL review of the 761 indicated it didn't work perfectly in QSK CW if there was much of an xmit/rcv offset, but this has never bothered me. A factory mod is available to help this problem, but it took the 765 to totally eliminate the problem. Good luck, John, W9NETLee wrote:

If you are limiting the size of the data part to 256 bytes as in the
current AX.25 specification, then I will agree with you. However, if
we take the maximum duration currently allowed for a single packet (2
s for 1200 bit/s), we can fit 2-4 KBytes into the same time at 9.6 -
19.2 kbit/s. Such long packets require some form of error correction
coding reducing the throughput a bit.

For text based applications the optimum packet size is 1-2 kbytes,
since it will fill the screen in one packet and the user will then use
some time to read/manipulate the page before sending some response
back. This was the approach used in block mode terminals in mainframe

transaction prosessing system and is also used in web browsers.

The only place that the use of unmodified communication grade radios is desirable is at the end user and only there. The end users are usually connected to a BBS/cluster and this is a tpical example of a client-server environment. Usually the bit rate requirement are quite different for the uplink (end user to BBS/cluster) than for the downlink. The uplink might very well be served by ordinary AX.25 at 1200 bit/s. The receiver at the server does not even have to use an equalizer. However, the downlink would certainly benefit from 9k6+ data rates. If there is only one server on a channel for a certain geographical area, the equalizers in the end user radios only have to train their equalizers for this single transmitter. The low speed preample could even be omitted.

From: maclamb@world.std.com
Message-ID: <E496xI.2FC@world.std.com>
Source record: 185616

Hello,

An addendum to post earlier post.

I have a Kenwood TS940AT with RS232 external 232 cable port and the 10F chipset installed inside unit for computer control. The unit is in the 7 Million serial number.

Have manual.....non-smoker...in excellent condition...

Dropping price to $1100 plus shipping but a matching Kenwood MC-85 mike included.

If interested, please e-mail or call 508-358-3687 work or 508/655-8775 after 4PM.

This is a good deal for someone wanting to make the big jump and have the whole thing computer interfaced as well. I did so with DXBase and packet and worked some great contests and DX.

My reason for selling? Moved to new location...all big trees and a slab one floor house = poor antenna plus no time.

73 and cul

You sure can, (most folks call this device a diplexer). A diplexer can
be used to connect two antennas to one dual-band radio, or two radios
(one VHF and one UHF) to a bual band antenna.

From: rfw@bright.net
Message-ID: <32e20ddc.3101537@news.bright.net>
Source record: 185620

Don't feel uniqe, this has happened to me on a VHF repeater. Sounds as if many RF transmitters are sharring the same room as the UHF repeater. Can you associate any new equipment to the problem ? Possible intermod products ?

It sounds to me like you may have taken a lightning hit. Check all of the inter connecting coax cables on the duplexer and to/from the radio for possible arcking. The best way to do this is to put around 2 Kv of DC power in to each cable and check for arking (be careful). Also check your transmission line the same way, of course disconnect the antenna.

May also be arking in your notch filters with in the duplexer. Go thru the alignment of the duplex using a signal generator and a spectrum analizer. When complete, look for your output frequency on the receive line from the duplexer. Do the same test but with the transmitter feeding power into the duplexer, becareful not to over load the analizer's front end. If you see your output signal be sure it is with in the spec of the duplexer.

Hope this helps.

Stun Guns - GSM Mobile Phones - CD ROMï¿½s - Satellite Gear
- Electronics

Check out our selection of goodies :Amateur Radio related Ham Tool Kit CD ROM, GSM Mobile Phones and accessories Electronics and so much more at our web site http://sphynx.com/murphy

To Check out our Stun Gun offer ..keep readingï¿½

What is a Stun Gun?

A Stun Gun is an electrical self-defense device that puts out a high voltage and low amperage shock. By merely touching a person with the stun gun, he is immobilized for several minutes with no permanent harm. Stun Guns are considered reasonable force to resist attack. They can be used many times to ward off attackers before the batteries need replacing.

Our Current Best Seller is the "Talon 250"ï¿½."The Finest Stun Gun in the World!"

Features:

Curved Head.
Strength: 250,000 Volts.
Power requirements: 2 X 9V Duracell Batteries (included).
Complete with hand-strap and belt clip.

Effects of the "Talon 250":

The Talon 250 Stun Gun does not merely rely on pain for results. The stun gun works on the muscular and neural system. A short blast of ï¿½ second duration will startle an attacker, cause minor muscle contractions and have a repelling effect. A sustained blast of 1 to 4 seconds can cause an attacker to fall to the ground and result in some mental confusion. It may make an assailant unwilling to continue an attack. A sustained blast of 5 seconds can overwhelm and control the attackers neuromuscular system IM-mobilizing him, causing disorientation and loss of balance. He will probably fall to the ground, feeling weak and dazed for some minutes afterward. Full recovery in this instance takes about 10-15 minutes. The "Talon 250" is effective through 1/2inch of clothing.

TALON 250 STUN GUN: ï¿½95 (Batteries included)

Methods of payment:

We accept payment by ACCESS, VISA or MasterCard.
NO Commission charged on credit card orders.
Credit card is debited only on DAY OF DISPATCH.

Isaac,
Some commerical hand held transceivrs, Bendix King 210
2-way radio's have channel banks, wher you can scan all channel
banks or some of them.
The term scan, meant changing frequency in the receive mode,
you could have over a 100 ham repeaters segregated by cities,clubs,
etc.

>coding reducing the throughput a bit.

Our VHF channels usually have a good SNR, and hence a low BER, so
you don't need heavy FEC. The main data loss mechanism on a contending
VHF LAN is collisions caused by hidden terminals. Without collision
detect, nearly the entire packet usually gets wiped out in a collision,
so even heavy FEC won't help. If we're going to use long packets, we
need to manage contention better than we typically do now.

>For text based applications the optimum packet size is 1-2 kbytes,

Page at a time is a little much for conversational keyboard to keyboard
contacts. Typically only a few lines of text are sent before the other
station replies.

>train their equalizers for this single transmitter. The low speed
>preample could even be omitted.

Excellent point. An asymmetric connection could be very useful for some types of activity. The cluster typically only sends out one line of text, however, a Dx spot, so a cluster based LAN wouldn't benefit from an asymmetric channel. The BBS centered LAN would benefit because it does fit the model of low volume uplink and high volume downlink.

Both the cluster based and BBS based LANs would benefit more from a different change. In both cases, they repeat the same information over and over again to each station on the LAN. When a cluster receives a spot for example, it will retransmit it up to 25 times to all the stations connected to the cluster. This is very wasteful. And typically, a BBS will download the same bulletins again and again as each user logs on and reads them. That's also very wasteful.

I think both applications would be better if they were implemented as broadcast servers, ala pacsat. That would greatly reduce the amount of redundant information transmitted on the channel. An asymmetric channel structure would be easy to implement for the broadcast paradigm too. User uplinks could be on a second low speed back channel while the servers share a downlink channel which they have arranged to be non-contending, IE they could share it round robin, or some other deterministic way. Then your idea of a low speed preamble followed by trained high speed data would work well.

I'm very pleased with my FT-50R. It is rather complex and not
"cheap". If you have the money to get one, I highly recommend it.
Get the ADMS-1C software, an extra 5 watt battery and if you can the
drop-in charger. I had one for about 2 months and then bought my 15
year old son one for his "Congratulations on getting your Tech" gift
and his first rig. He takes it to high school every day and just loves
it.

Fellow Amateurs,

Our radio club is doing some major renovations this year. One big part of that renovation will be to construct a new Radio Console. We would like to have one of those nice one's that you see on the cover of QST or CQ magazine. We don't have an unlimited budget, but we were thinking of possibly doing the whole project in two stages. Perhaps building the main console base and desktop now, and adding the upper shelves later. If you know of a source of nice console design plans or have any input into important things to include at the building stage, please write me.

Thank you,

Hi!

I am going to purchase a GMRS handheld, but can't decide which one and =

would like some opinions. I currently own 2 Uniden GMR100's and would =

like to get something with more features a larger range but can still be =

used with them. Am considering the following:

-Maxon GMRS 210+3
-Radio Shack PRS-101
-Radio Shack PRS-102

Right now, most likely is the Maxon, but would like to hear opinions and =

thoughts about which is the best for features/value vs. price.

Thanks in advance!

Andrew

> Can anyone advise me on the "first" one?

Yeah. I just got an FT-50R. Love it. Great radio for the price. It does
everything I want in a handheld.

Kurt

the only mods for 160 I ever heard of is you have to gut the amp and redo
almost everything. I think I saw the mod detailed out in a recent copy
of The Collins Journal by Dave Knepper W3BJZ.

Need some help with specs on a Motorola Micor base. This unit was in service with an agency of the U.S. Government on the 406-420 MHz band. I need to know if it can be tuned to operate 440-450 MHz. Some say yay, some say nay.

Model # C64RCB-3016AT-SP429
Serial # 301CHW00xx

If any of you Motorola guys out there can help, I would be most appreciative.

^^

>that some of them will have real expertise (that's just simple population
>statistics). Also, because special development tools aren't required for
>hardware debugging, and because the base C++ compiler can be used for most
>algorithms, learning how to do DSP programming should be easier, so more
>people will gain the expertise that you (correctly) see as so lacking now.

I'm not convinced that it will make much of a difference.
I own a DSP4 and I have written some programs. I have previous knowledge
of C and assembler, but what I encountered while writing programs was
not only the 56001 assembler hurdle (that I could overcome in a few
weeks), but also the signal processing theory hurdle (that I could not yet
overcome).
So, I was able to write a POCSAG decoder/encoder by sticking together
some filters and a clock regenerator found in sources of other modems,
and writing the POCSAG bit-handling stuff myself. I would not have been
able to come up with the filters and demodulation techniques myself. This
would not have changed when I could have used C or C++, it is not a
coding problem, it is a design problem.
(I also wrote an EEPROM programming program for the DSP4, which is no
signal processing program, and I had no problems with it)

The situation will probably be the same for most programmers who want to
enter the amateur radio DSP field. For non-programmers who have to learn
what assembly programming is about, things may be easier in C. But then
they better be signal processing experts, because having to experiment
in these two disciplines at the same time is almost certainly leading to
failure...

>The hardware base suggested is sufficient to achieve markedly better
>performance than most available hardware solutions for *voice grade
>radio* use, and likely better than some dedicated platform DSP solutions.
>Speeding packet up beyond that requires special RF hardware, and in some
>cases, requires regulatory relief. That's a worthwhile direction to go,
>but it isn't the only direction where cutting edge improvements can be
>made.

Given the time that DSP cards are available to amateurs now, I am no
longer that optimistic about what they are going to do for packet radio
modems...

(of course I was enthousiastic when I first heard those lectures about
experiments with multitone PSK modems, but where are they now?)

>This shouldn't be looked upon as a method to achieve higher UHF+ packet
>speed. This is intended to improve average performance in the low to very
>low speed arenas, especially for weak and noisy signals, IE satellite, HF,
>etc.

I'm afraid it has turned out that way, yes. How often have we heard the
question "why can't we do some decent speed over an FM radio channel when
the telephone folks can do 14k4 (28k8, 33k6, the speed they compare with
has only increased over time while we were kept at the same 9k6 rate)"?
Of course I know some explanations for that, but not all of them are
completely unsolvable.

We (in the Netherlands, also in the rest of Europe?) at least seem to
have the regulatory advantage that we have no bandwith or baudrate limit
imposed on our transmissions (other than the band edges)...
Nice to have one advantage over the USA, where a super-ego (who once,
long ago, lead the BBS software field, you probably know him) is trying
to condemn any limitation to hamradio message content or source
identification found in other countries as censorship :-)

Andrew,
I would strongly recommend the MAXON 210+3. I'm dissapointed in the
PRS-101s I have as they are simplex only and suffer from IMD terribly.
Just after I purchased two PRS-101s because there were no GMRS
repeaters in my area, a local ham club is considering putting up a
Vertex GMRS repeater. Now, I plan on purchasing a Maxon SM-2000 mobile
unit and two 210+3 HTs. Anyone want a couple of barely used PRS-101s
for a good price?

Andrew:

Keep in mind, the Maxon has the ability to work with a repeater...the GMR100 does not. The Radio Shack PRS series, require an optional accessory to work with repeaters.

Bill Crocker

Excellent in my opinion. They're great for digial modes, too. I've got one I've used since they first came out. The only problems after a number of years was with the VCO. Called ICOM, they have a kit of new variable capacitors (cost about $9 as I remember) to be installed inside the VCO can. Seems the original type corrode after several years.

Fellow Amateurs,

Our radio club is doing some major renovations this year. One big part of that renovation will be to construct a new Radio Console. We would like to have one of those nice one's that you see on the cover of QST or CQ magazine. We don't have an unlimited budget, but we were thinking of possibly doing the whole project in two stages. Perhaps building the main console base and desktop now, and adding the upper shelves later. If you know of a source of nice console design plans or have any input into important things to include at the building stage, please write me.

Thank you,

Message-ID: <32E2FB20.432E@erols.com>
Source record: 185717

I have just acquired a Diamond RH519 flexible 2m/70cm HT antenna. This antenna is advertised to have +3dB gain and to be ultra-flexible. In my limited experience with it, it seem to perform at least as well as the dual-band helicoil that came with my FT-50R.

Yes, it is ultra-flexible, but it has a propensity to bend at the base. How soon will this $35 antenna break off, or can it be straightened out repeatedly without breaking?

Thanks,
Todd KF4KHM

Source record: 185720

Hello,
I thought I'd tap into the great minds that frequent this group for some help. I have a Yaesu FT-51R that I think is a wonderful little rig except for one big problem. I seem to have receiver overload on the 440 side. I'll be monitoring and I get what sounds like TV or a cordless mic system "flash" in and out repeatedly. I get this whether I use a duck or attic antenna. I get it whether I'm at home or on the road. Yes, I do live in a metropolitan area. The problem is quite annoying and can sometimes make the 440 side useless.
Are there any mods, filters, or whatever that anyone recommends to help with this problem? Thanks in advance.

>the equalizer if there are changes in the propagation path.

Nice idea... of course, it would be best if it was set up in such a
way that all variable equalization would be done at the receive end,
so that everyone can receive transmissions by a single station.

Difficult to predict how well it will work in practice...
(ok, maybe you could run a simulation when some parameters of different
types of transceivers are known)

1635. Kenwood TH-79A(D) advice.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-19 00:00:00 UTC
From: Scott Anderson <saa@helios.ece.usu.edu>
Message-ID: <32E2A123.2DC3@helios.ece.usu.edu>
Source record: 185722
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I am in the market for a handheld, dual-band transceiver.
I have previously asked about the Yaesu FT-50R and have
received many favorable responses. I am trying to compare
it to the Kenwood TH-79A(D), and am having a hard time
finding reviews or resources on the Kenwood.

I am interested in opinions of the TH-79A(D). Especially
from those who have owned and operated one. Is durability
a problem with the Kenwood? Does it have the quality that
I might expect given the $100 price increase over the Yaesu?

Thanks in advance for any advice!

Scott Anderson

Hi Mike-for all of your needs, it would be hard to beat a good used Yaesu FT 757. They have general coverage from 500Khz to 30 Mhz, it can be simply modified to transmit "out of band"-keep in mind that it is ILLEGAL to use a radio that has not been type accepted for marine use, peforms very well on TX and RX and shpuld be available for under $500-I just sold mine for $400 so I could buy a FT900. They are a well built and rugged radio, and mine gave me no real problems during the time I owned it.
Good luck in your search. 73's es CUL de Chris WL7PV

All the radio shack two meter rigs do it. Both my HTX202s have the
birdy, but usually they are only audible on the rubber duckie. On a
real antenna, if you drop open the squelch, you can tell there is
something there, but not bad enough to hurt RX generally.

I can't say about the 242 cause i've never had one, but the 212, when I
had it, did the same thing. It was usually only audible with no antenna
connected. A couple of times, it got much worse, the birdie was s6/7.
I opened up the rig and found the screws securing the circuit board were
loose. After tightening, all went back to normal. Dunno if this voids
the extended warranty or not.

I believe the problem is the 41st harmonic of the 3579+ xtal oscillator.

Mike:

Any of the rigs you listed will do a fine job for you. One exception might be the TR-7, as Drake had some problems with the early units.

You might also consider the Drake TR-4 and the Heathkit SB-102 as well. I've used both for many years and have nothing but praise for them.

From: ej_mars@lagn.com
Message-ID: <43260863@lagn.com>
Source record: 185736

I just purchased this Motherboard (MB-1433/50UIV-A PCB Ver 6)., it uses the UMC Chip Set (UM83C3498) . It is VLB with 2-72 pin and 4-30 pin simm sockets with a Socket 3 Zif CPU Socket. I was told it supported 486/586 Cpus, but the book that was supplied does not give the jumper settings for the 586. I would like to install a Cyrix of AMD 586-133. Does anyone know the jumper settings? It is presently set for a Cyrix 586x120 as follow:

JP 11 1-2 closed, 4-5 closed
JP 12 1-2 closed, 4-5 closed
JP 13 1-2 closed, 3-4 closed
JP 17 1-2 closed
JP 18 3-4 closed, 5-6 closed
JP 19 1-2 closed, 3-4 closed
JP 20 Open

If other jumper settings such as clock are required please also supply.

Thanks

I trolled the BA email list for opinions for the following question,
so now I'd like to hear views from you folks.

I've got a Galaxy GT-550 that runs two 6LB6's in parallel. I never
run over 50W (honest!), so rather than having both 6LB6's idling
along, I was thinking of removing one of them (to keep as a spare).
But in doing so I'm afraid of creating some imbalance.

One person already warned me that the B+ might shoot up; in testing
that claim I might end up damaging the remaining tube.

Has anyone tried this on any other rig? Opinions? Warnings?

Also, is there a (cheaper) replacement for the 6LB6?

:::::::::: MFJ-989C VERSA TUNER V ::::::::::

I won this one as a door price recently at a local "get-together".
It has never been used, and the warranty card is still in the box.
I have no use for it, as I already have one just like it.

Here is the description of this unit:

Covers 1.8-30 Mhz, 3KW PEP, matches everything: coax fed, random wires
and balanced lines. AirCore Roller inductor with spinner knob and 3-digit
counter. Peak reading cross-needle SWR/wattmeter 200/2000 watt ranges. 50
ohm, 300 watt dummy load, 4:1 balun, 6-position antenna switch, tilt flip
stand.

The 989C is MFJ's biggest and most expensive antenna tuner.

ASKING: $270 (I pay shipping and C.O.D.)

It may be able to be "modified" by tacking capacitors, changing coils, etc. But plug and play, on 440 and up is very, very unlikely. I have used some for amatuer link radios in the 420-430 range with no problems, but, a few that we were tuning around 428 were getting very close to craping out.

Les:

I have the Radio Shack PRS-101. It seems to work fairly well, however the build quality isn't too good. It doesn't have pl tone capabilitys either and won't work repeater offsets. I didn't need these features, and paid less then $100.00 for a used one so I went with it.

I looked at the Radio Shack PRS-102(Motorola) It looks pretty good. I don't think it will do repeater offsets, and the pl tone is an optional accessory. I think it runs about $40.00 for pl capabilitys. The build quality for this radio looks to very good though.

Bottom Line:
If I were buying a new unit then I would definitely get the Maxon 210+3. (I am thinking of getting one myself!) If you can find the PRS-101 used and dont need tone/repeater capabilitys its a good buy only if you don't pay more than $100.00.

Just my 2 cents!

From: spkatzmann@ccgate.dp.beckman.com
Message-ID: <spkatzmann.5.000BED22@ccgate.dp.beckman.com>
Source record: 185556

I was an Icom freak, but when it came to buying a new dual bander recently I looked at all of them (except the V7A - it came out a month after I bought mine). I purchased the Yaesu FT-8500. I wanted a remotable control head and required the alpha memory labeling. I would have bought the 733 otherwise even if it is being disabled. Ive used the 733 and like all of the features. But no alpha.

From the other postings Ive noticed that the V7A doesn't have sub-band muting - not good. The 8500 does, but it is disabled when transmitting - also not great but better. It looks like the programmers just don't use the radios?

Steve.

> I am about to invest some money in a new radio, and as a kenwood freak

I'm looking to mod my radio as soon as the warrenty is null and void. I want to make is so that the audio (thats both uhf and vhf - all audio) is muted when transmitting. If you own an FT-8500 you probably realize that you can set the radio up to be a cross-band repeater, but you cannot work a cross-band repeater because you'll get nothing but feedback (unless you use an earphone of course). You also notice that the sub-band muting is disabled when you transmitt - most annoying!

Anyway, if you understand what Im saying, do you have any ideas about how to do this to the radio? It would also be nice if the "feature" could be disabled with a switch or something.

Steve.

I just recently got an AEA RL-1. I would like to talk to anyone else who has this equipment. I appear to have two different versions of software. U5 is V1.0 and U6 is V1.5, both copyright AEA 1993. Anyone know what is going on here?

I am also having trouble with the initialization. It will recognize the default password and the code for my radio (FT-990) but it will not accept the next command for the new password. Any suggestions?

I can order cables from Yeasu that have the 4-ring male connectors,
but that still doesn't give me something to plug my Yeasu speaker/mic
into when I have my patch cable plugged into the HT.

Where are the 4-ring female connectors available from?

I really like the features of the Kenwood. I have used one for 6 months now and it has everything I have needed so far.

> Does it have the quality that
> I might expect given the $100 price increase over the Yaesu?
The price difference is because the Kenwood is a true dual-band while the Yaesu is only a dual-watch. Comparing the Kenwood to a Yaesu FT-51 would be a better comparison there. I have not had a problem with the Kenwood (and have used it in some tough conditions), but I would suspect that the Yaesu would perform quite well also. My only major complaint about the Kenwood is that the receive audio is not very loud.

If you have checked ftp://oak.oakland.edu/pub/hamradio/mods and found nothing, you're probably out of luck. Mods for Radio Shack radios are quite limited; that's why I never buy one.

If you ever need a Kenwood mod, e-mail me and I will do my best for you.

In reference to the other response you received, I do wish people would lighten up about type acceptance (and I mean the general public, not the FCC, which has more serious concerns than type acceptance to worry about.) I would certainly appreciate reading anyone's comments on this issue.

>
>Also, is there a (cheaper) replacement for the 6LB6?

I've been working on a output tube substitution for a Drake TR4 so I've had
a chance to delve into a related topic. Here are my observations:

1. Some rigs have weird series/parallel arrangements for filament voltage,
because they were designed to allow for 12V mobile operations but are filled
with a mix of 6V and 12V tubes. If one tube is removed (open filament) the
filament voltage on others can go too high. Check this and put a power
resistor in place of the removed tube's filament if it is a risk with your
radio. This is a critical factor to work out ahead of time.

2. Total final input capacitance will change. This could throw off the
preselect/tune control settings slightly. You can compensate by putting a
small capacitor between the removed grid and ground to simulate Cin for
the removed tube.

3. The idling bias current should be adjusted for half of the original value
because only one tube is idling.

4. The output impedance of the final - to - tank circuit interface will be
upset, which will at least alter the final tune-up settings (plate & load).

5. Neutralization will probably be upset, so you'll need to check the results
of that setting.

6. I wouldn't worry about B+ - the circuit will be designed to survive highest
B+ at zero or low idling plate current. Altho the remaining tube will see
higher B+ at full plate current than normal, you've already said you'll adjust
for less than full output (from the remaining tube...) so I doubt plate
dissipation would be exceeded on the remaining tube. As for screen voltage,
that should be regulated already by a 0B2 type gas regulator tube so I don't
think it will change for the active remaining tube.

You _might_ consider as an alternative just removing (grounding) screen voltage connection at one of the tubes, which should drive it's plate current to zero. Then re-adjust idling current and see what happens. Altho the remaining tube would have it's filament lit, it wouldn't be subject to much emission life depletion at zero plate current. At least this might be an experiment to run before you do any more major surgery.

Another alternative might be to find a dead 6LB6 or a pair of very weak ones and use them instead.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

Last October, I picked up a fairly clean Swan 350C. After recapping it and the power supply and aligning the rig, all seems well. However, I have two problems as of yet unresolved and hope someone with one of the beasts can steer me in the right direction. Here goes:

1) The S-meter deflects right to left (downscale). I've replaced the diode and check resistances in the bridge. I have a copy of a manual for a Swan 350 and it mentions something about this, but sure seems strange. Any ideas?

2) I can't seem to get semi-breakin CW with the VX-2 Vox unit. Works fine on phone though. No mention in the manual about semi-breakin. Is it possible in an unmodified radio or am I missing something?

Any help will be greatly appreciated.

Tnx... de Karl - W5QJ

Any ideas?

Dennis, I would like to know this also, I have 3 packs for the the
C228A that are totally useless and would like to restuff them if its
possible...

73, -Jim- (kd1oq)

****

Dennis, Jim, et al:

There are actually two different ways to open these packs. I have a Standard C558A which uses the same packs.

One way is to use a 'hot' knife. Weller makes a tip for its soldering irons that is very much like an X-acto blade. This will cut through the seam and open up the pack very nicely. A regular X-acto will work, but it's much harder to cut through and the edge becomes ragged quickly. Also, if you're not careful, you can cut though the batteries inside ar through your finger quite easily.

To reseal the pack, you can use a small flat tip on your iron to flow the plastic back into a seam. Or you can glue it together using Duco, silicone seal, or epoxy (5-minute). I have used all three successfully. Be aware that the finished product will look like it has been taken apart and reassembed.

The second way I discovered accidentally. Let the battery pack drop onto a hard cermaic floor from about four feet and what it snap open! Reassemble as above. Be aware that some smal pieces may never be found!

On a related subject, have you (or anyone) had a problem with third-party (e.g. Periphex) batteries not staying snapped into place on your Standard HT as securely at the Standard brand packs? All my Standard packs (and the one Heath by Standfard pack), snap securely. Both Peripex snap in but fall off easily. I have adjusted the springy metal slides, and it helped somewhat, but not enough.

My new Yaesu FT-8500 has sub-band muting (both full and partial levels) but it is disabled during transmit!? This makes the radio incapable of working a crossband repeater! The only way to do this is to put on headphones or where an earplug - not acceptable solutions. I'm currently looking for a mod to disable the audio completely while transmitting. I can't listen and talk at the same time anyway. But still haven't heard anything. I have used the 733 and it has everything implemented the right way. If it was not for the fact that I need the alpha memory labeling, I would of bought one of those.

Steve.

>I just had the pleasure of checking this out also. Yes, it does still
>work, and works great. Fantastic amount of info on the old gear.
>My compliments to the person responcible for the web site.

Greetings. I had a lot of fun browsing that site:

http://linux.cec.army.mil/hamradio/equipment/mi.html

... If you cheat a bit, and enter only part of the URL:
http://linux.cec.army.mil/hamradio/equipment/

You will noticed that on top of the 2-3MB of text that describes each item, there is also a 12MB directory (and TAR file :-) of schematics for same. I checked out a few of these and while they will never win a prize in clarity, they are more than enough to figure out what's going and what wire does what.

He is looking for images of as many of these items as possible, if you have something, please let him, NJ7P (bbeech@huachuca-emh8.army.mil) know you can help!

Take care.

P.S. Someone should to make a CD-ROM with that info on it...

Alot of it has to do with how you use your radio.
The SW-77 with a well selected antenna connected will perform almost as
well as any of the mentioned tabletops overall.
If you are targeting hams, utilities(ssb)or obscure tropicals(noise) the
optional filter selections and noise reduction will help.
I have a SW-7600G that I connected to a 4' ground plane. I also have a
Kenwood TS-850s with extra filters, DSP and a full size dipole. When all
is said and done that $200 sony performs pretty dam well. If I can hear
it (AM signals)on the kenwood I can hear it on the sony and alot of the
time better using asynchronous detection.

Hello,
I am selling the a Realistic HTX-404.
It's in PERFECT condtion.... Comes with unit and battery.

It has no Manuals. This is because it was given to me by a friend who had
no
interestes in Ham Radio. So, he didn't keep any manuals or box for the
unit.

I am selling it for $120.00 + Shipping. If you look into the latest Radio
Shack
store they are asking $199.99 for them now.. so, its a great deal!

If interested please contact me...

Thanks N9MXT - Jeffrey

bboy> How do I get a cable to connect between the FT50R and the
bboy> TNC.

I do not know of a commercial source. As far as I know, you will need
to make your own custom cable.

You buy an Yeasu FT-50R cloning cable (available by mail order from
HRO, AES, and no doubt others), cut it in half, and solder the proper
wires to the proper pins of a serial connector (available from Radio
Shack) to connect to your TNC's serial port. The cloning cable
consists of two identical 4 ring plugs connected by a cable. You only
need one plug and a length of attached cable. The Yaesu FT-50R's
manual shows you the identtities of the rings of the four ring
connector which connects to the FT-50R radio. The TNC's documenation
shows the identities of the pins of the serial connector on the back
of the TNC.

The Yaesu cloning cable will cost approximately US$10.00. The serial
connector shell will cost less than US$2.00. You have to furnish the
soldering iron and solder (both available at Radio Shack for less than
US$15.00, total). Bring your TNC with you when you visit Radio Shack
so the staff can help you get the a serial connector with the proper
number of pins and sex for your TNC. An ohm meter would also be a
useful tool, also available for less than US$30.00 at Radio Shack.

1708. how to reset a Heath HW24 2m/400 mobile rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-20 00:00:00 UTC
From: 70365.1370@CompuServe.COM
Message-ID: <5bulc9$6b4$1@arl-news-svc-5.compuserve.com>
Source record: 185643

I've got a bit of a problem here, and I hope someone out there
can help me with it.

I picked up this used Heath HW24 dual-band (2m/440) mobile rig, and
have been using it quite happily. All of a sudden, it will no longer
transmit, the controls are acting funny, etc. My guess (and that of
the two hams who were the previous owners of this rig) is that the
on-board microprocessor has freaked out and needs to be reset. However,
in the voyages this radio has taken to get to me, the manual has
disappeared.

So, does anybody know how to reset this radio? I can't find a lithium
battery in it anywhere convenient (and I'm leery to take it apart
further without knowing what I'm dismantling), nor a reset button of
any sort. It's been off power for 4 days, and it still acts weird
when I power it up again.

Alternatively, does anyone have a manual for this model radio they
would be willing to sell? I will pay a reasonable price for one.

Please contact me either here in the newsgroup or via e-mail.
Thanks in advance.

I own a Motorola Spectra the A5 Model and am having some difficulty with it.
I currently have a DTMF mic on it and works OK.
I want a regular mic to work on this thing. I put one on and I get no audio during transmission. I really want to have a standard Mic on here. Anybody have a clue as to why it transmits with no audio? The mic I used to test it with came off another Spectra that works fine. It should work? What am I missing?

Any heavy Motorola Tech's out there??

>receives a spot for example, it will retransmit it up to 25 times
>to all the stations connected to the cluster. This is very wasteful.

A few years ago Vesa OH3NWQ wrote a PC based program to extract the
DX-spots by monitoring messages sent to some other connected users.
It did not gain popularity among DXrs since you had to connect to the
cluster to send talks and send your own DX spots. A much serious
problem was that at that time, the typical VHF/UHF setup at a DXrs
station consisted of an old crystal controlled radio, a TNC and a dumb
terminal or alternatively of a modem chip and the C64 (and I allmost
forgot, these stations often included an FM-booster if there were any
problems staying constantly connected to the cluster). A smart program
did not much of a chance to win popularity in this environment.

>And typically, a BBS will download the same bulletins again and
>again as each user logs on and reads them. That's also very wasteful.

A pacsat style system would be nice if all users would have radios and
computers that would be on 24 hours a day. Until Linus and Windows NT
becomes more popular, I don't think the pacsat principle would be
popular before that.

An other problem with the BBS forwarding traffic is that no one is
reading 90-99 % of it. It is distributed to all BBSs but also to all
end users requiring a lot of air time and disk space. A better
approach would be to store the actual files in a few places and
distribute only the headers. The users could then retrieve the
messages bodies required. With some caching at the local BBS, the main
part of duplicate traffic would be eliminated. This would require a
(preferably duplex) backbone network with short latency time.
For this type of operation the asymmetric end user connection would be
preferable.

I am offering my professional services to those who would like a WWW site to promote themselves or their services. This offer enables those who either don't know html and Java or don't want to spend the time to do it themselves to have a site on the net. This is available to anyone in the world (although I operate out of the US)

For $30 I will
1) write your homepage based on your own personal specifications.
2) post it to the net and maintain it.
3) Advertise it to appropriate search engines (including all the top engines like Lycos, Infoseek and Yahoo)
4) Provide you with the ability to maintain the site yourself if you wish.

There are no monthly charges and changes/ updates can be made to the site on a regular basis. The low cost is achieved through quick planning and the usage of free servers to host the sites. This service is ideal for individuals looking to get involved in the WWW for the first time or anyone interested in a prescence on the web (People interested in trading items, families with kids, political and environmental causes etc). There are restrictions in the content which will be explained as we discuss the nature of your site.

Your site can be up in less than two weeks. e-mail me for more details (send response to ahorn@soundcom.net).
I am a private web-designer operating on my own out of my home and this is what I do for a living. I also provide services to professional organizations on a consultation basis.

Global Web Solutions.

>>-Maxon GMRS 210+3
>>-Radio Shack PRS-101
>>-Radio Shack PRS-102

The Maxon 210+3 is the ONLY unit with CTCSS capability, making it the ONLY one of the three that should be considered for serious communications work. Here's a blurb I prepared when the Maxon 210+3 was released...

FINALLY A RADIO DESIGNED SPECIFICALLY FOR THE G.M.R.S.
Clint Bradford

Maxon has just announced a new UHF transceiver designed exclusively for the GMRS, and which has USER FRIENDLY multiple-repeater capabilities. This model is not (like most other GMRS radios) merely a reworked version of some other commercial model. This one has features which are uniquely needed by GMRS licensees, especially those who travel.

10-channel positions -
Channels 1 through 7: the seven non-repeater "interstitial" frequencies (462 MHz only).
Channel 8: the 675 channel, user selectable from the front panel for EITHER repeater or direct communications.
Channels 9 and 10: dealer programmable for any 2 of the other 7 PRIMARY channels, also front-panel selectable for either repeater or direct communications.

With the front-panel repeater offset selection for channel positions 8 through 10, this could actually be considered to be a THIRTEEN-channel radio.

CTCSS tone-code selection: FRONT-PANEL USER SELECTABLE for ANY of the approximately three dozen common tones plus another dozen extended and "in-between" tones, fifty in all. The user can quickly change the tone code on any channel. The capability to change the code no longer requires access to internal programming or the use of a special external programmer. It's all accessible on the front panel.

Transmitter output power: Depending on the battery or power source, from 2 to 5 watts output, with a low-power (1 watt) front-panel selection.

This is the first UHF transceiver since the mid 1970's designed exclusively for the GMRS with a repeater capability. It is also the first GMRS radio EVER to include user-friendly, front-panel-

accessible multiple CTCSS selection.

>I have a Standard C228A h/t with a mostly-defective CNB151 battery pack.

I have had nothing but positive experiences with my purchases from THE NICAD LADY in SOuthern California.

She offers a CNB-151 insert for $19.00 (7.2V/950mA)...and a rebuilt one for $24.00. BUT - she can also make you a Nickel Metal Hydride unit! Call her at 909-789-0830 for details.

MAHA makes an excellent little replacement for us, too...their CNB-153. The MAHA battery is the same physical size of the CNB-151...yet it is rated at 1200mAH versus the Standard's standard 700mAH rating.

The only physical difference is its weight - at 6.4 ounces, it is a little heavier than the Standard at 5.7 ounces.

The MAHA is also compatible with the Standard CSA-181 desktop charger - to a degree. I just finished talking with a MAHA engineer, who actually recommends that we use Standard's regular wall charger for 24 hours for recharging, rather than the desktop charger and its rapid charging circuitry. We can expect up to 1,000 battery charge cycles using the wall charger, and only about 500 cycles using the desktop rapid charger.

1717. Info Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-20 00:00:00 UTC
From: wlbackus@ix.netcom.com
Message-ID: <32E3289B.3114@ix.netcom.com>
Source record: 185652

I have two Kenwood TS-520 SSB Transceivers, with optional CW crystals installed, which received some heat and smoke in a minor house fire. Apparently the heat and smoke were very little as the exteriors are in perfect condition. The current operating condition is unknown and I do not have the equipment to check them out.
Questions: Should I sell them, as is, and for how much? Or should I have them checked out, repaired if necessary, and sell them at a higher price?

Your comments are appreciated.

Reply E-mail only: wlbackus@ix.netcom.com

Does anyone have a circuit for a fairly siple rf bridge.
I want to use it to measure antenna impedance etc.
I have a signal generator that goes to about 110MHz,so the signal generator
part of the circuit is not realy needed,only the bridge and detector.
Any help would be appreciated
Cheers
Rob

Cough up a few extra bucks and have a Motorola radio (i.e. Radius line)
programmed for GMRS. You won't be disappointed.

1721. Advice on HF receiver..

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-20 00:00:00 UTC
From: phloem@islandnet.com
Message-ID: <5bv4e6$ta5$1@sanjuan.islandnet.com>
Source record: 185656

I've been into scanning for a while, and would like to expand my horizons beyond (or perhaps below) the 30MHz limit, which is currently what all of my scanners have as the lower frequency boundary. As a result, I'm going to have to buy another radio in order to be receive the MF/HF broadcasts needed to get into ute monitoring.

The only problem is that I know next to nothing about these receivers - what to look for, or (perhaps more importantly) where to go to buy one. I've poked through the catalogs from Grove and haven't found much in the way of information WRT what kind of receiver to buy. I don't want something really fancy, that'll make me spend great heaping gobs of money - search would be a nice feature, along with user-definable channels to scan through. (Basically, I want your basic scanner for the under-30MHz part of the spectrum.) The ability to select USB versus LSB would be a plus, but really I'm after the voice transmissions.

So I'm looking for advice. Any will be much appreciated.

Thanks in advance.

From: vsn@ic.ac.uk
Message-ID: <5bvsh3$2pl@deimos.ee.ic.ac.uk>
Source record: 185670

Hi everyone,

I'm a newcomer to the amateur world and I want to buy a dual band handheld with simultaneous receive on both bands plus AM airband reception. This is going to be my first transmitter :-). The way I see it is that I have the choice between the Icom IC-W32, Kenwood TH-79 and Alinco DJ-G5. (Do the Yaesu FT-50R and FT-51R have simultaneous receive on both bands?)

If you have used one or more of these before, would you tell me what the differences in features are and which one you would prefer? The FT-50R and DJ-G5 are significantly cheaper than the Kenwood and Icom. Is there something missing?

I'd like wideband receive and transmit but wideband receive is not very important because I've got an MVT-7100...

I notice the FT-50R has Digitally Coded Squelch. Am I to assume that the others don't? How important is it?

Have you found independed band controls to be convenient or not?
What would you say about the Icom Delta-1 tri-bander?

Is there anywhere I can get a collection of reviews maybe?

Sorry for the barrage of question but it's an expensive buy and I don't want to regret it...

Thanks,

--

In addition to being very illegal, there is only one modification that
will work, legally or otherwise, to make the 212 go out of band
transmit.

Here it goes. Take a clean work surface, and cover it with something
to ensure that the screws do not get lost.

Take the 212, and set it face down on the surface.

Take a type accepted radio, for the band you need, and set it, face
up, on the back of the 212.

Take duct tape, and tape liberally.

There you have it!

The mod pretty well guts the unit. You get a single band amp with tuned input, very stable, >60% efficient, (mine is near 70%), very clean output, easy (!) to tune. For those without a candidate amp, Carl will procure one for you. The power supply is beefed up, and the rest of the innards look brand new.

Frank,

Check out the opinion poll results at
http://www.tiac.net/users/ke6ber/dvsmpsum.html.
1000D takes it. Read the QST extended reviews and look at the design
differences to see why the 1000D is preferred.

Is there a VHF mod that works?
I found one, and would like an opinion to see if it works and if it reduces the performance of the rig.
TNX

++

To expand the band on the VHF portion. Caution: This is quite involved. If you are not too good you might be advised to get someone who has the experience to handle this mod!

1. Remove the main board from the unit. Keep the cutout hole away from you. This I consider the top of the board.

2. Remove the shield from the top of the board. There are 30-40 solder points from the shield to the board.

3. Under the board on the top of the board, remove R-353 and Q-38. They are located to the left of the
IC-36 chip on the top of the board under the shield.

4. On the underside of the board, Locate IC-32. There are two IC chips. IC-32 will be just down and to the right of the shield.

5. Using a pointer, point at the left upper pin, and go toward the top of the board. You will find a trace that stops. It comes out from under IC-31, and stops. It should be the sixth trace up from the top of the Chip.

6. Using a Xacto knife, (or something similar) Cut the trace the bend halfway between IC-31 and the solder point.

7. Make a jumper wire, and jump the connection, from Pin 11 of IC-32 to the newly isolated trace.

8. Reassemble the radio.

========== End Part 2 ==========

Buy yourself a Drake TR4C (~$250) or a Yeasu FT101ZD Mark II or Mark III (~$375).

yes, it has tubes. yes, one has an analog dial and the other doesn't offer absolute accuracy even tho' it has digital readout.

Initially save your money going low ball. Then when you get the rig tune in on the rudeness on 75 meters or the trader net heckling on 40 meters. Then decide if this hobby is for you.

hey! one man's opinion.

In America, we "advise" politicians continuously/constantly.

Trouble is, they never seem to take their constituent's advice!

Is GB similar?

FS: Icom 775DSP and AT-100

I ship, or you can meet me at the Miami, Ham Fest on 1st and 2nd of Feb 1997.

No COD's, Send Certified Check or Money Order, since I hear on the news groups people have problems receiving the COD and that a bad personnel check could be used for payment.

FS: Icom 100 watt - AT-100 Antenna Tuner $225.00

Icom AT-100 matching external automatic antenna tuner for Icom radios, with 4 automatic switching coax antenna connections. Comes with the standard control cable that connects to the back of an Icom Radio, An optional OPC-118 Cable is required for the 725,726, 735, 761, 781 and others refer to the transceiver instruction manual. It operates on AC or DC. $225.00.

The unit in very good condition, operates perfect with the manual, however I don't have the
Original box.

IC-775DSP: $3,500.00

The radio is in New/Mint condition no smoking and always covered, All 5 filters installed, plus the CR-582 crystal oven. All Original and no modifications done. Original Box and Manual.

Reason for selling; use very little and more radio than I need.

Radio can be seen at: http://icomamerica.com/amateur/hf/

Specs. Below from the Icom page.

Pull Out Those Weak Signals with ICOM IF-DSP!

Dimensions: 16.7 (W) x 5.9 (H) x 15.4 (D), 36.8 LB
DSP (Digital Signal Processing) TX/RX
200 W Stable Output Power (SSB/AM/FM/XCW/RTTY)
Built-in Heavy Duty Power Supply
Fully Adjustable DSP Noise Reduction
Level/Width Variable Noise Blanker
PSN Modulation
Audio Peak Filter
Dual Watch (2 Receivers)
Dual Tuning Knobs
Twin Pass Band Tuning
Power MOS FET PA Section

Electronic Keyer
Memory Keyer
CW Pitch Control
CW Reverse
Two Key Jacks
Large, Easy-to-Read Display with Amber Background

Nicely articulated, and carefully modulated, Steve.

Hold on, the judges' scores are in: 9.5, 9.3, 9.4, 9.6, 9.8,10.0. We have a perfect 10.0 in there!

You know, Steve, please personally remind me never to buy ANYTHING that Dave sells. Apparently he believes that sellers are sacrosanct, and that this is some kind of GNP-contributing industry, not a HOBBY, and the fact that L-7's went from $7-800 up to $1300 in asking price for no good reason other than greed in the last 2 weeks should go uncommented.

What's worse? Commenting in good humor on a laughably high price, or insulting someone's intellect?

See my website for other inflammatory opinions.

: Does anyone know of any commercial 2-way radio newsgroups or web sites?
: --

I posted an article like this a while back and got heaps of replies saying
there was nothing but everyone would like there to be something.

For web sites just go to your favourite search engine such as
www.lycos.com and search for words like motorola, tait, specfic models etc.
A couple that I know of are:

MOTOROLA http://www.mot.com

TAIT http://ds.dial.pipex.com/akmobile/tpmr.htm
http://vellocet.insync.net/~taitus/

CHICAGO COMMS http://www.chicomm.com

Also the newsgroup rec.radio.swap is mainly commercial 2 way based.

Cheers

Matt

1764. WTB: Lafayette BCR-101 Receiver

Source record: 185450

I'm looking to buy a Lafayette shortwave receiver, model BCR-101. This is a mid-70's analog solid state set apparently intended to compete with the Realistic DX-160. Has a vertical drum dial and built-in front-facing speaker. This set was marketed during the decline of Lafayette, after their long line of HA-XXX series ham and shortwave sets.

Am very interested in this receiver and can swap for classic 1930's - 1960's sets (even an SW-3!), or buy outright for a cash money order.

1770. WNT: Did you buy this at a swapmeet?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-21 00:00:00 UTC
From: Ted <teddyb@caprica.com>
Message-ID: <Pine.BSF.3.91.970121210437.18872F-100000@prog1.caprica.com>
Source record: 185456

WANTED: King KMC-95 high-seas marine transceiver
WANTED: King KMC-96 auto-tuner for the KMC-95

They were sold as-is at swapmeets as merchant-marine surplus for $15.00 to $20.00 each back in 1995.

The KMC-95 has a white plastic case and a black face with red LED readout, a volume & squelch knob and a 16 button keypad for frequency & channel selection.

One reason they were so cheap is because the pre-programmed ITU channels in this 15-20 year old transceiver's ROM are no longer valid channels,(the ITU changed the channel frequencies in the late 1980's), so they are useless for marine service since all of the AT&T and other high-seas ship-to-shore marine operators are only on the new ITU frequencies.

Additionally, with the advent of High-Seas Digital Direct HF service, these voice/cw-only transceivers are of little use in maritime radio even when a new frequency is directly entered via the keypad, since making calls ship-to-shore that are assisted by a live-operator are very soon to be a thing of the past.

I am willing to pay upto $40 for either the KMC-95 or the KMC-96, thus giving you a 100% profit over the swapmeet price you paid, DEPENDING on the condition of the unit,(if it's not working and good only for parts, I might only want to pay you $10 or $15 for it... which is fair).

Please reply via private email.

Thanks.

1773. Info wanted on 2M xcvrs!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-21 00:00:00 UTC
From: Ted <teddyb@caprica.com>
Message-ID: <Pine.BSF.3.91.970121213312.18872H-100000@prog1.caprica.com>
Source record: 185459

I need a make & model list of all 2 Meter ALL-MODE mobile transceivers made between 1980 and 1990 that had ALL of the following features:

1: Built-in "PL" subaudible transmit tone encoder,(not needing that ugly, bulky external tone encoder like used on Kenwood's TR-9130), and may,(but not required), to have subaudible tone decoder for receive.

2: Built-in DTMF tone encoder for transmit,(if it also has a DTMF decoder for receive, that's okay too, but I only required it to have a DTMF encoder for transmit).

3: At least 16 or more independantly programable memory channels for storing the input/output/PL parameters of your favorite repeaters.

4: Now sells as "used" for between $200.00 to $300.00 (max) on the average.

5: LCD readout.

6: Output power on high is 10-15 Watts RMS on FM and 15-25 Watts PEP on SSB

7: Modifiable/Modified for MARS use.

8: Totally solid-state.

9: (optional, not required) RS-232 port for hookup to an IBM-compatable TNC

10: (optional, not required) also has 222-225 MHz band

11: (optional, not required) has built-in auto-patch with RJ-11 jack.

Please reply via private email only.

Please note: If it is not 2 Meter, if it is not a mobile unit, if it is not ALL-mode, if it does not meet all the criteria of items 1 through 8 above, please do not reply.

After I know what different models with these features were produced and sold in the USA during said years-gone-by, I'll be in the market to buy one of them.

I can't believe that the ONLY older solid-state 2M all-mode now selling on the used market for $200-$300 is the ancient and feature-starved Kenwood TR-9130... But in my area that's the only one I EVER see for sale.

1774. Re: Help Open TX/RX FT-415

I don't know what your laws in Venezuela say about this, but in the USA hams are allowed to convert radios made for other services to be used in the ham bands without government "type-acceptance", but ham radios are not allowed to be adapted for use in non-ham bands without government "type-acceptance".

The term "type-acceptance", meaning that that model of radio is approved by the government, for use in the intended band.

There are 2 reasons why licensed hams do not need their radios to be type-accepted for use on ham bands:

1: We are allowed to build our own radios from our own designs if we so choose.

2: We as hams agree to be responsible for our radios to operate within legal specifications on ham bands and we are required to prove that we are able to do so, which is why we must pass a test before we are granted an amateur radio (ham) license. But owners of business-band radios are not required to have any such technical knowledge, since they usually will pay a licensed service-technician to maintain their radios.

1775. Looking for PL tone mod for Kenwood TS700A

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-21 00:00:00 UTC
From: spammers@must.die.com
Message-ID: <wsandersE4DGA7.n0A@netcom.com>
Source record: 185461

I have started using the old TS700 my Dad left me and it was made before the days of repeater PL tone activation. I understand there are tiny PL circuits available so I can use this unit with repeaters but the local Hams-R-Us isn't too specific about how easy they are to install.

I'd like any hints about which of the units available are easy/difficult to install, work/don't work, etc.

The TS700 has a mechanical resonator from back in the days when repeater activation tones between 1500 and 2500 Hz. Would I have a chance of finding a resonator for 100Hz? I doubt it would work anyway since the tone is not sub-audible.

Thanks in advance from the 144.2 neighborhood. It's a good neighborhood but the locals are getting impatient when they respond to my piddly little signal with their 1500W 6x6 20-element EME arrays and find out I'm only 3 miles away.

> 4. MFJ 9020 20mtr transceiver. Xlnt CQ mag review... $120
> 6. Icom 02-AT 2mtr HH w/desk chrg & 4 bp7 &bp7s batts. $190
> 8. Hammarlund HQ-150 rcvr. Super Clean. $225 (split ship)
> 9. Drake R4-A rcvr. w/MS4 spkr. Super Clean. $165 (split ship)

I don't mean to sound negative, but are we supposed to already know what bands the above radios are made and for those listings that say what bands, what features they have or if they're base or mobile units?

I mean, it's not like your being charged by the word for how much info your post contains. :)

> 12. Kenwood PS-52 pwr supply. $160 (split ship)
> 13. Kenwood PS-53 pwr supply. $150 (split ship)
> 14. Icom PS-15 pwr. supply. $135 (split ship)
> 15. Emco PS-12L (10 amp HD) pwr. supply. $50 (split ship)

How many volts & how many nominal/surge amps?

> 16. Kenwood MC-50 Desk Mike. $50
> 17. Icom SM-8 Desk Mike. $80

How many pins? What type of plugs? Are they pre-amp or not?

> 19. FJ 989B 3kw ant. tuner. $180
> 20. MFJ 986 3kw ant. tuner. $170

For what bands?

> 21. MFJ 921 2mtr ant. tuner. $40.

What's the max. power?

> 22. MFJ 208 2mtr SWR analyzer. $50
> 23. MFJ 207 HF swr analyzer. $50
> 24. MFJ 259 HF swr analyzer w/opt case. $170

What analysis features?

> 27. MFJ 1116 Multiple DC outlet strip w/mtr. $30

What kind of connectors?

> 29. Ameritron RCS-4 Remote Coax Switch (Desk unit only -
> not the antenna switch box or cable.) $45

Does it use SO-239, BNC or N connectors?

Again, I'm not trying to be a pain in the rear-end, but if I left out such info I wouldn't mind if those not familiar with the make/model of equipment I post asked me for more details too.

It's hard to know if one should be interested in and can make use of something if the description is as vague as a mere mention of the make and model.

It's not like we all have spec sheets on every radio made.

I might be interested in some of your listings if I knew they were of use to me.

Agreed, stick with the common denominator. If you switch rigs for
any reason, you'll be useless if you only knew how to operate the
paddle. When your speed is up to snuff, wire both of them in, and
keep in touch with the straight key.

Works for me 486 - 33mhz, 8meg, soundblaster, etc
(Gotta use EMM386 or as Don has Qemm.)
Decoding takes some tweaking but I got it working in the ham
bands on rtty and weather FAX.

Every decoder I have (hardware) really takes tweaking and
experience, I am still evaluating this
software (shareware), but it looks promising.

1789. Help?? ALINCO DR-110T Tech Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-21 00:00:00 UTC
From: mmss@mmss.sdi.agate.net
Message-ID: <5c2c0t$2b7@service-2.agate.net>
Source record: 185475

Hi,

I wonder if anyone out there can help me? I have an ALINCO DR-110T 2m FM transceiver with some interesting symptoms:

Radio is always on; push button will not turn it off.

It receives fine, but will only transmit for about half a second... then the radio momentarily shuts off (the whole radio) then comes back on but of course reset to receive mode even though the mic is still keyed.

It seems to be overly sensitive to power supply voltage. If the supply voltage drops below 13, the rig shuts off.

Now, since we all know that little tiny push button can't possibly switch 10 amps (or whatever this thing draws), I am assuming it is just used to control some kind of "relay" device (solid state I am sure -- optoisolator? solid state relay? what?) which actually controls power to the radio. I rather suspect this device has failed, causing these symptoms.

I don't want to go poking around in there without a clue what I am looking for. Anybody know where the device I'm looking for is in the rig and what it looks like? And what it is? Or am I barking up the wrong tree entirely?

73,
Paul N1BUG

1793. FT-736 50 MHz problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-21 00:00:00 UTC
From: Bill Harwood <harwood@sirius.chinalake.navy.mil>
Message-ID: <32E576E4.5410@sirius.chinalake.navy.mil>
Source record: 185479

I put a 50 MHz module in my 736 which was working fine. It already had 2M, 440 and 222. Everything still works fine except....

On 6 meter frequencies sometimes there will be no power out (on FM or sideband). The transmit light is on and the green modulation light blinks but the power out meter and external power meter say nothing is comming out.

I turn it off and go away and somtimes I come back and 6 meters works fine. Sometimes it does not work for hours or days.

There is no SWR problem to in the feed line.

Anybody have any experience with this condition and any suggestions on fixing it. I am not sending it away to Yaesu until I have a predictable failure or a known problem.

Thanks,

Bill Harwood

I also run ATI Mach64 card. (also QEMM)
My vidio card required the VESA driver.

This card has some strange behaviour with
programs that make VESA calls without the
driver.

Look for 64VBE200.ZIP from ATI. Contained
in this .ZIP is the driver M64BE.COM which
is a DOS TSR.

BTW the program runs in an OS/2 DOS full screen
session (with the tsr installed.)

1795. V7A OOB TX Mod + More...

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-21 00:00:00 UTC
From: David Gan <gandt@ccom.net>
Message-ID: <32E5BB1B.A27@ccom.net>
Source record: 185481

The OOB Tx mod for this radio is the same as the
TM-733. Locate the 2 SMD resistors near the 2 green
wires. Remove one of the 2 resistors. It is at jumper
location 0 among positions 0 through 5 (next to a metal
grounding spring). If any geen wires were cut for the mars/cap
mod, reconnect them. The new tx range is:
TX RX
136-173.995 118-174 MHZ
410-469.995 300-470 MHZ

Also, be aware of a bug in the V7A control software.
A specific combination of user settings can cause loss
of control where it can't even be turned off.

To see if your V7A has this bug, activate PAGE mode
by pressing [F, DTSS] twice. Before doing this,
make sure that:

1) AIP (Advanced Intercept Point) is ON
2) 'L'ow power is selected
3) Memory Recall Mode is ON (ie, a channel number is visible)
4) 'T'one is ON

Press F,DTSS and F,DTSS again...

If the unit has the defect:
1) A 'M' will appear in the power setting
2) The ON-AIR indicator will appear (no Xmit though)
3) No controls will work including the OFF SWITCH.
4) Disconnecting power and reconnecting power may
still leave you locked out.

To regain control:
1) If PAGE appears, immediately press LOW , or,
2) Try disconnecting power then reconnecting it, or,
3) If you are really stuck,
briefly hold down the MIC TX and press "Low' or Tone.
When you regain control, press the power off switch and
leave AIP off or don't try to use PAGE mode.

Kenwood is aware of the above and has offered a fix when
they have a solution.

Other than the above control software bug, I really like
my V7A.

Regards.

Question: What is a simple, inexpensive, and convenient way to start this year off in a FUN, intriguing, and romantic fashion?
(Santa must have been holding out on this one!)

Answer: Dateline!

Now that Christmas is over and you have given everyone else presents, it's time to treat yourself to something nice.....that someone special. Someone to share in your hobbies, your interests, your lifestyle, your LIFE.

Dateline is the perfect way to find someone and be found! Dateline gives you the forum to seek out others whom you find interesting, and let others know about you! And the best part is - you are in control of what happens. Call often to leave and receive lots of messages (remember - this service is HUGE and there are so many people from all the area codes across the country calling in to find people just like you!), or call in as little as you like and leave and receive a few selective messages. You can also call just once to see what the heck it is all about. Whether you are a little shy or outgoing in the biggest of ways - it is a simple and inexpensive way to find other singles. It is amazing how much fun people have with Dateline!

It is so convenient! You can call in from anywhere at anytime to give and get your messages. This is a 24 hour service and you just punch in whichever area code you are interested in - whether it is in the place you live or the places you go! And it is really super if you relocate and want to meet up with guys and gals who share your interests and would love to show you around! (No wonder Santa is always so jolly - his sleigh phone has the Dateline speed dialed in!)

1-900-484-7009 ext. 5241

$2.99/min. Must be 18 years or older.

Serv-U (619) 645-8434

Make this your Happy New Year's Resolution: To call Dateline today and start giving and receiving those personal messages! Join in the fun - and don't keep those folks who want to meet you waiting until next Christmas.....

The MIC i got (standard one from yaesu) has a rubber plug on it which
will accept a 3.5mm(?) speaker plug.

I know this is an ugly solution, having all those wires coming from your
mic, but it will allow the operation of a speaker, and the mic- with
no new cables to assemble.

Cheers

Source record: 185496

Hello all, I have a GE Master II repeater for sale.
It has the following:

Scom 7k repeater controller (top of the line)
Phelps Dodge 6 cavity Duplexers
70 Watt GE Master II w/ hamtronics preamp.
Doug Hall Remote Base Interface (RBI-1)
Keeping the kenwood radio

This does not include the antenna, hardline, or power supply.

The reason I am selling is because I also have a 2 meter repeater and we are expecting a baby at anytime. I had to get rid of one of them, and I have too much in the 2 meter machine right now. I have to think of the family at this time.

Asking price is $1,200 neg. please contact me via email first. Then if interested I will gove you my private number. Corey N3GZW

I have a Icom 720a hf rig that I would like to sell or trade for a 2m all mode. The rig is in mint condition and I have all the manuals. It comes with the matching speaker, power supply and desk mic. I would like to trade for ether a Kenwood 711a(with tone installed) or a Icom 275h. I live in the Chicago area and would deliver within 80 miles. I would prefer to do this locally but would ship out of state.

The price for the radio without trade is $550 firm. Please E-mail for any info.

You don't.. you have to post a message to a control group (I think
it's some alt. newsgroup. may be in news.admin hierarchy...) and you
then have to have like 20 or so people 'second' your request for a
newsgroup.. real pain. Maybe someone else knows an easier way, but
that's what I was told.

RJ ("telephone") modular connectors are ASSEMBLY connectors. They are not made for high cycle count removal insertion. They are best suited to applications such as telephone handset cords and line cords - When the cord goes bad, unplug it and throw it away. Plug in a new one. Total time: 5 seconds.

Properly crimped, and left plugged in, you should expect about the same life from a cable equipped with a modular connector as with a DIN connector.

6 meters on hf rigs is not a new idea, but is a good one brought back.

Globe 680's, Knight t-60, Harvey Wells Bandmaster, and others all had
6 meters included and there was much activity on the band with QSO's
possible 24 hours a day, AM and CW.

Globe (1950's), Knight (1960's) by Allied Radio the ancestor of Radio
Shack, Harvey Wells (1950's) also included 2 meters (and 11 meters which
was a ham band at the time.)

i own a yaesu ft8500. i have the manual. i have read the manual.
looking in the AES catalogue i see it says cross band or one way repeat
i can not find in the manual how to do one way repeat? does anyone
know how to do this? i would like to listen to the shuttle on my handi.
but i do not want to be able to transmit back onto the shuttle freq.

also does anyone know how to mute the microphone while cross banding? i
used to just pull the mic off my 732 but i can't do
that
with this one <?>

thanks for any help

scott,

1828. Digital readout for Swan 250 / help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-21 00:00:00 UTC
From: cjs9@cornell.edu
Message-ID: <5c2eq4$kn7@newsstand.cit.cornell.edu>
Source record: 185523

after dealing with my 250 being off freq. ie not what the dial says I am wondering if anyone has ever tried to use a Radio Shack digital freq counter for a readout?

I know it should be a simple matter of tapping in at the right place, but there are tubes in there and I am ashamed to say my knowledge of tube circuits is lacking to say the least.

I have tried to use the counter externally, but no luck. Any and all suggestions are welcome.

please E-mail me at cjs9@cornell.edu
73 & thanks

>BOX). SBFFT is like this.

Yeah, at least you can get the main screen up if you reboot to DOS mode,
but when you give it the run command, it crashes and burns. It appears
to put the SVGA card in a very strange mode. The monitor goes into sweep
protect. And the only way out is a hardware reset. That's with it configured
for the default 640x480 mode, which should work on any hardware. I haven't
tried it yet in 1024x768. PC is a 100 MHz 486DX4 with 16 Mb RAM running
Windows 95 and using an ATI Mach64 video card and a Soundblaster 16 sound
card. I configured the EMS memory, and at sign on the program Oks that and
finds and checks the sound card Ok too. But give the Run command and the
screen goes dead and the machine locks solid. Not pretty.

1835. Collins 618T HF

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-21 00:00:00 UTC
From: tobyhuff@ix.netcom.com
Message-ID: <853858915.18285@dejanews.com>
Source record: 185530
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

Can anyone with Collins 618T experience help me? I (as a member of
Colorado Civil Air Patrol) have installed a Collins 618T into an ambulance
[used as a mobile command post] for disaster response preparedness. The
radio was taken from a USAF MRC-108 communications central. The entire
MRC-108 radio package was installed in the ambulance, sans radio
"coffins". The UHF/AM and VHF/AM radios work perfectly. The problem is
the Collins HF. Receive mode works fine; the antenna coupler aligns to
the frequency selected, albeit a bit slowly. However, there is
no transmit, and the meter on the R/T does not show 1500 Volts. I've
tried 3 different R/T's, 4 different 1500V power supplies, the equipment
rack and wiring twice, and the control head twice. It acts like an open
interlock, but the blower interlocks have been bypassed, and I know of no
others. The only thing not swapped out as yet is the antenna coupler, and
I doubted if that was the problem. Has anyone using the Collins 618T had
this problem? Any help or suggestions would be welcome!

Source record: 185533

I need a new dual band mobile 2/440, and what radio has the best receiver
ie: NO INTERMOD?

I bought a Yaesu FT8000, and in my area it is useless.

I had a Kenwwod TM742 and never had any of these problems:

Yaesu FT-8000 report: SN 6J040098

FREQ PROBLEM

118-136AM AIRCRAFT wiped out - even at airport, a signal at 134.825 was
readable
but the audio was to low.

144-148 constant intermod, birdies wiped out
numerous times

220-222 wiped out, birdies

440-450 constant intermod, birdies EVEN FM RADIO
BROADCAST on 450.000

460-470 useless!!!!!!!! wiped out BIG TIME

800-900 reception OK, cellular blocked

1100-1280 CELLULAR RECEPTION, DFQ!!!!!! Wipes out 1200 amateur!!

I bought the radio because I have an FT50. The 50 BLOWS this piece of Sh_t
away.

I know Yaesu made changes to the radio to block cellular, but they have BIG
problems with this radio. It's a shame because it looks great and is set
up nice.

Maybe we need to start a class action like AOL is getting, to straighten
out the radio manufacturers. I am tired of the only guaranteed in amateur
bands line. My radio shack scanner works better than this, EVEN IN THE HAM
BANDS!!!

STAY AWAY FROM THE FT-8000 UNTIL THEY FIX IT!!!!!!!!!!!!!!!!!!!!!!

Mike:
Assuming you find a mod to extend the receive, there is a real problem that not only your rig, but a lot others out there share: you can't tune that last digit (the hundreds of Hz digit). Some scanners can do it, but no ham rig I know of. 'Tis a shame, though, as some of the Nascar Winston Cup crews radios communicate on freqs that utilize the 500 Hz digit (I'm a race fan and would like to listen in on those teams that do).

Having operated both transceivers extensively I finally chose the FT1000D and am very pleased with my decision. I am a low power DXer, not owning an amp, and the extra 3DB was a big help in working VK0IR on the first day of pileup mayhem. I also appreciate the separate band and antenna capability in the split receiver. It is very useful for HF broadcast SWLing. As for the DSP features inherent in the MP, I purchased the Timewave DSP599zx and now have an FT1000DMP!

Hi,

I am set to embark on an adventure. I want to try building a computer controlled fully automatic antenna tuner. This ought to be fun...

It would simplify things if I only had two components to adjust (at least I think so) instead of the usual three. I have noticed something called a "Differential-T" tuner that is being produced commercially, which has just two adjustments: the roller inductor and the differential capacitor. Hmm, interesting... maybe.

Can anyone who owns one of these tuners please tell me something about it? Does it tune easily or is it terribly finicky? Does it require a lot of juggling back and fourth between the inductance and capacitance settings to achieve a match? Or is it more or less possible to adjust one element, then the other and have a reasonable match right off? Are there situations where it will not tune? (I am primarily interested in tuning coax-fed antennas. For example, I have a 5 band trap vertical that doesn't provide low enough SWR on some frequencies for my rig).

Also, can anyone tell me the circuit configuration and component values? I'm not at all sure how they have the inductor and capacitor connected. Oh, yeah, are both sections of the differential cap the same value, or are they different?

Any information would be appreciated. I can probably build my own differential cap, but I'd just as soon not go that far until I have some idea whether this circuit will work for me and what value to shoot for.

Ahh, I do love projects that let me combine computer programming with ham radio!

>de N2MPU Jack

Hi, Mike and Jack

I have a new W32. I'm not much into microsurgery, so I asked the dealer to do whatever mods were available when I bought it. Looks like ICOM has finally been able to block cellular 800 MHz receive, though the radio tunes the rest of 800 and 900. I can dial in 470.6125, but I don't know how sensitive it is there.

Jack - this radio, and all other Icom's I've owned since 1990, tune the "500 Hz digit" just fine. I can punch the frequency in directly from the keypad (4-7-0-6-1-2 and the radio adds the "5"). And you can step thru those channels with the channel step set to 12.5 kHz. You can't step through them with the radio set to 5, 10, 15 or 25 kHz.

The channels are not set on random 500 Hz increments across the band. The minimum channel spacing is 12.5 kHz, and most radios tune the appropriate 12.5 kHz channels. They'll all end like this:

XXX.0125
XXX.0250
XXX.0375
XXX.0500
XXX.0625
XXX.0750
XXX.0875
XXX.1000

However, when you consider the bandwith of the receiver, if you're tuning in 5 kHz steps, you'll never be more than 2.5 kHz "off frequency." You'll never notice that when tuning strong signals, and weak ones might be a

little distorted. For example, you want to tune 470.6125, but for some reason your radio only tunes in a minimum of 5 kHz steps. You dial in 471.61, and you are 2.5 kHz low. Dial in 470.615, and you're 2.5 kHz high. Neither is a big deal. One of them might sound a little clearer, since either you or they might be a bit off frequency.

Ha Ha...you matriarchal little weasels! You have the unmitigated gall to "decide" what people should sell things for and scour the newsgroups offering your "expert" opinions. (of course, you know so much about pricing that your opinions can't possibly be wrong, serving only to confuse buyers)

Of course, only the *buyer* can set the price in the used market (except for in extremely unusual cases), but that fact doesn't faze you because you apparently know nothing about economics. You honestly believe that the seller sets price levels and that you need to help poor, helpless buyers through the process. You wouldn't "buy from Dave" because, surely, he would rip you off. After all, you have no idea what should be paid.

You are too dense to see that actually I am a SELLER's advocate. I understand that sellers will decide what they would pay, I understand economics and business, and most importantly I have faith in sellers' intelligence. None of the same may be said for you and your fellow little price police.

Now flame away. You are only showing how little you know with each sentence. Do you actually think people *appreciate* what you are doing? Let's face it...you are just looking for a way to feel important, and that is a pity.

1852. AL-1200 Amp Opinions Pls

Date: 1997-01-22 00:00:00 UTC
From: wstrahl@nwsca.nw.att.com
Message-ID: <5c604l$8sb@nntpa.cb.lucent.com>
Source record: 185346

I am considering acquiring a contest-quality amp, and I have heard
pretty favorable comments on the Ameritron AL-82 (2 3-500Z's).
Are there any users/opinions regarding the AL-1200 and if that one
might be a better choice ? What plate voltage is used ? Is it
'instant-on' ? What kind of drive pwr for what output ? How's the
blower noise ? Can it handle a RTTY contest without melt down ?
Hw do U use it on 12 & 17M ? Have there been any magazine reviews by
astute people ? All info/comments appreciated...

Happy contesting/DX'ing from my corner of the black hole,

Wayne - W9II wstrahl@nwsca.nw.lucent.com

I have had to return both my ft-530 and ft-900. Both times they have returned the rigs much earlier than the 4 weeks that they promised! Only thing is they don't return stuff in the box that it came in. So...if you don't want to lose the original boxes for your rig, send it to them in something else!

equiptment is as follows:

YEASU FT-101-EE- in perfect shape, non smoker, still has factory plastic
on face, finals in very good shape, comes
with 2-new finals in the boxes too.

YEASU FR-101 communications reciever/ vfo/ 6-digit freq counter.
this unit has 6, and 2 meters in it as well
as 10,11,13,15,16,19,20,25
31,40,80, and 160 meters. and this unit
works as a vfo when
used with the FT-101 with a 6 digit counter!
has the factory
plastic on the face still! perfect
condition.
YEASU YO-100 matching O-SCOPE with factory plastic on still. works
great.
will also let you monitor the patterns on
rx.
YEASU LANDLINER phone-patch unit in matching cabinet, works great.
YEASU EXT SPEAKER matching ext speaker
ASTATIC SILVEREAGLE this mike goes with this package.
I have all of the factory owners manuals in superb condition, with the
factory schematics. also, i have some of the origional boxes, and some
custom slip covers for them. PACKAGE ONLY, PLEASE,,,,850.00 PLUS SHIP

GLEN CUSTOM 1600 in perfect shape, uses 4---4cx250r tubes. variable
output.
have the origional owners manual, and
schematic.NOT A
SCRATCH ON IT. 1000.00 + ship

DRAKE RCS-4 remote coax switch box, 5-position. have origional paper
work.
55.00 + ship

ASTRON VS-50-M 50 amp power supply, with amp & voltage meters. variable
voltage adjusts from 2 volts, to 15 volts
externaly. in perfect
condition. 200.00+ ship

YEASU G-800-SDX very nice rotor. 21 sq. ft. load rated. rs-232 input
for computer control. only 4 months old. have
all paper work.
350.00 + ship

Well, I might be able to help you with that. Make sure you have your
EMS memory manager installed in config.sys, and make sure it isn't set
for NO EMS (that's the default way it'll be with Windows). Just delete
the NO EMS from the line and reboot.

Well it was pretty much ad advice to everyone, not just to you. Many people I'm sure are unfamiliar with many models of radios. Important details such as what bands, what modes, mobile or base, etc, if not stated, leave someone who never heard of the given model scratching their head or going on to the next FS ad. Someone who has only been a ham for say, 4 years, will likely not know anything about a model that was discontinued 2 or 3 years before he got his license, since it won't appear in all those wonderful catalogs that flood your mailbox when you get your first ham ticket. And even the current ones are too numerous to memorize.

I thought it was a fair point to make for all to keep in mind.

To many people, just the make & model number don't tell a thing about features, and it won't kill the advertizer to type a better description... will it?

>

I have had an AL-1200 for about 3 years, and have been extremely happy with it. It has the QSK-5PC QSK module built in (factory installed).

Plate voltage is about 3200 under full load. Takes around 90 watts for full output. Blower is certainly not silent, but it is not terribly intrusive -- and I keep it on the "high" setting (an internal strapping option). I have not used it extensively on RTTY so can't commment there -- but I did use it some when I first got it, and there was no indication of overheating. It is flawless on QSK CW.

Tunes smoothly to full power on all bands without a hitch.

>Les Wilson (nessman@servtech.com) wrote:
>: Does anyone know of any commercial 2-way radio newsgroups or web sites?

There is an LMR mailing list:

You need to subscribe using the following instructions:

Here is the info:

submissions should (from now on) go to

lmr@ucsd.edu

and requests to join or leave the list (subscribe or unsubscribe) go to

lmr-request@ucsd.edu

or if you want daily digests instead of individual messages,

lmr-digest-request@ucsd.edu

Turnaround time for messages is usually minutes, although bulk mail like
this gets a lower priority than person-to-person mail, so it may get
delayed sometimes. We deliver over 100,000 messages on a typical day.

The blurb that describes the list when people query our listserver is

>The LMR mailing list is for discussions regarding Land Mobile Radio, or
>more informally, "commercial two-way radio". This includes police,
>fire, EMS dispatch and telemetry, taxicabs, trucking, aircraft radios,
>automatic vehicle location, and pretty much all non-broadcast,
>non-amateur, non-CB radio. Perhaps we could call it 'professional
>radio' without being too far out of line.
>
>For-sale and new product advertisements are NOT welcome.
>
>Rather, emphasis should be placed on technical discussions and the
>other matters that affect the business of running a two-way shop:
>new laws, regulations, band allocations, usage patterns, competition,
>all those things that affect sellers, providers, and users of
>two-way commercial radio. Since this is an international network,
>discussions of how things are in other countries are well in order.
>
>Remember to keep it civil and friendly, please.

>
>It wouldn't hurt to check your spelling and grammar either; there are
>more than a thousand people reading what you write.
>
>Enjoy.
>
>submissions for publication to: lmr@ucsd.edu
>subscription matters, list format: lmr-request@ucsd.edu
>subscription matters, digest format: lmr-digest-request@ucsd.edu

One thing you'll notice is that we do NOT set the headers to force
replies to the list. Depending on your mailer, you'll automatically
reply only to the author unless you select the "reply to all" option
- for example, in the Berkeley MUA, you'd use 'r' to reply to the author
or 'R' to reply to the author and the list.

If you find yourself replying to 'mailfail@ucsd.edu', your mail user
agent is misconfigured and needs to be fixed. 'mailfail' is the error
address where undeliverable mail goes - and it's mostly a bitbucket.

Our list handler software is being revised and will, we hope, soon be
able to filter out administrivia like subscription requests that fools
send to the list instead of the admin address. It doesn't do that yet
but we're actively working on it.

Digests are issued about 4 am Pacific time each day that there has been
any traffic, and additionally whenever 32kb of mail has accumulated.
They'll be archived on host FTP.UCSD.EDU in the /mailarchives directory,
just like all the rest of the digests we issue.

Have fun!
- Brian

See you on the list.

44	1205.8750

45 1299.9125

* So far I cannot find any out of band frequencies but if someone found one such as 888.960, you could unblock the 869 to 894 MHz part of the band. Other Uniden made scanners (PRO-23, PRO-46, PRO-51) can restore this
part of the band by this trick. Some of these use several key combo's to load different freq's like 2, 9, & MANUAL loads one type of test frequencies and 2, 9, & LOCKOUT loads different ones such as the PRO23. The KEY seems to be that all key combo's start with a 2 & 9 with one other
key held while power turned on. This holds true on most Uniden made scanners like the above including the 3000XLT & 9000XLT.

Hold 2, 9, & CTCSS while turning power on - counts from channel 1 to 25 Bank (A) very slowly in Demo Mode and displays the following message:

"Uniden America Presents You A New Bearcat BC8500XLT Specifically Designed
For Professional Scanner User. Features Such As 500 Channel, Continuous Band Scanner V.F.O. Control, 20 Banks, 25MHz to 1.3GHz, Turbo Scan, 10 Priority Chs, Auto-Store, Aux.Tape Output, Alphanumeric LCD display. Great Stuff!! For Example DPS Dallas Texas HWY Patrol"

* This message is displayed over and over. This will only work if you first Hold the 2, 9 & Scan keys while turning on the scanner and then turn it off. Finally Hold the 2, 9 & CTCSS keys and turn on the scanner. I guess this was used to demonstrate the scanner at the CES.

Hold 2, 9, & PROG while turning power on - Display goes blank and can hear background noise/static like listing to an channel with the squelch open while channel not active. (Not sure what it's for, maybe a test mode or a Program mode. Very Strange). Any ideas?

Hold 2, 9, & MANUEL while turning power on to clear all channels to 000.0000 MHz. You can use this like a system reset to clear ALL memories.

There maybe other keypad tricks but this is all I found so far. Don't you love the Uniden programmers. I'm looking for the game thats been rumored to be hiddened in it's firmware. I'll find the secrete key tricks someday unless someone beats me to it.

If you know anyother keypad tricks for the BC8500XLT please E-mail me.

Thanks, Carl.

HAMFEST March 9, 1997 Lindenhusrt, NY

GREAT SOUTH BAY AMATEUR RADIO CLUB & SUFFOLK COUNTY RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEAST-COMPUTER SHOW - MARCH 9, 1997

LINDENHURST, NY -
On March 9, 1997 the Great South Bay Amateur Radio Club and the Suffolk County Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the Knights of Columbus Hall located at 400 South Broadway, Lindenhurst, NY. This is an ARRL approved Hamfest.

There will be radio equipment, electronic componets, computers and access-ories, softeware, books, technical manulas, ARRL information, Amateur Radio
License Exams and information. General admission is $ 6.00.

For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID),
and the examination fee, to the exam seesion. 1996 ARRL/VEC fee is $ 6.25,

exact change is appreciated. Novice exams are free.

For vendor and additional information pleas contact, Walter Wenzel KA2RGI at (516)957-0218, Lou Meister N2YBX at (516)842-9159 or Andy Feldman WB2FXN (516)928-3868, during EVENING HOURS ONLY (7PM-10PM). NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the limited space available. Tables
are 2.5ft x 6ft.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL and 223.86 OC.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm on the WB2FKZ repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

Hi all;

I have just received my general ticket and am new to the ham seen. I need your opinions as to what to purchase. Lets assume that money is not an issue. That reliability is of utmost importance. That all freq. that can be used by a general ticket could be used (HF,VHF,UHF,Ghz) . That a person has basic knowledge in electronics and he would be the one that has to repair it. Also that this equipment will be located many miles (200+) from civilization as we know it. What would you suggest? I appreciate your response as this will determine which MFG that I will go with.

Mike

Message-ID: <E4F4sx.JHt@scn.org>
Source record: 185373

:::::::::: MFJ-989C VERSA TUNER V ::::::::::

I won this one as a door price recently at a local "get-together".
It has never been used, and the warranty card is still in the box.
I have no use for it, as I already have one just like it.

Here is the description of this unit:

Covers 1.8-30 Mhz, 3KW PEP, matches everything: coax fed, random wires
and balanced lines. AirCore Roller inductor with spinner knob and 3-digit
counter. Peak reading cross-needle SWR/wattmeter 200/2000 watt ranges. 50
ohm, 300 watt dummy load, 4:1 balun, 6-position antenna switch, tilt flip
stand.

The 989C is MFJ's biggest and most expensive antenna tuner.

ASKING: $270 (I pay shipping and C.O.D.)

I am helping an estate of a SK sell an Icom IC-745 and have no idea of the value. It is in good condition 8+, no extra filters or keyer or calibrator, i.e. just the stock radio. Recently aligned, receives and transmits well, signal reports are good. Comes with the standard (no up/down button) mike.

Any estimates would be appreciated by the family.

Paul, your project sounds very interesting. The automatic antenna tuner in my Icom IC-765 does just what you are talking about - you might want to get hold of the tech manual for that or a similar rig for ideas.

I have done a limited amount of tuner circuit modelling by deriving the equations for the circuit and then expressing them in a spreadsheet using complex notation and operations to handle reactances and complex impedances. Very interesting exercise and very enlightening as to to capabilities of a given circuit with specified component value ranges to handle various load impedances.

A good modelling/simulation program, such as the one ARRL markets, would probably be much more convenient to use. At any rate I urge you to consider modelling first to arrive at a suitable design and approximate component values as a starting point for the software phase.

Keep us posted on your progress.

Subject:
LMR mailing list
Date:
Wed, 22 Jan 1997 22:59:27 -0500
From:
Henrik Rasmussen <rik@vnet.net>
To:
nessman@servtech.com

You need to subscribe using the following instructions:

Here is the info:

submissions should (from now on) go to

lmr@ucsd.edu

and requests to join or leave the list (subscribe or unsubscribe) go to

lmr-request@ucsd.edu

or if you want daily digests instead of individual messages,

lmr-digest-request@ucsd.edu

Turnaround time for messages is usually minutes, although bulk mail like
this gets a lower priority than person-to-person mail, so it may get
delayed sometimes. We deliver over 100,000 messages on a typical day.

The blurb that describes the list when people query our listserver is

>The LMR mailing list is for discussions regarding Land Mobile Radio, or
>more informally, "commercial two-way radio". This includes police,
>fire, EMS dispatch and telemetry, taxicabs, trucking, aircraft radios,
>automatic vehicle location, and pretty much all non-broadcast,
>non-amateur, non-CB radio. Perhaps we could call it 'professional
>radio' without being too far out of line.
>
>For-sale and new product advertisements are NOT welcome.
>
>Rather, emphasis should be placed on technical discussions and the
>other matters that affect the business of running a two-way shop:
>new laws, regulations, band allocations, usage patterns, competition,
>all those things that affect sellers, providers, and users of
>two-way commercial radio. Since this is an international network,
>discussions of how things are in other countries are well in order.
>

>Remember to keep it civil and friendly, please.
>
>It wouldn't hurt to check your spelling and grammar either; there are
>more than a thousand people reading what you write.
>
>Enjoy.
>
>submissions for publication to: lmr@ucsd.edu
>subscription matters, list format: lmr-request@ucsd.edu
>subscription matters, digest format: lmr-digest-request@ucsd.edu

One thing you'll notice is that we do NOT set the headers to force
replies to the list. Depending on your mailer, you'll automatically
reply only to the author unless you select the "reply to all" option
- for example, in the Berkeley MUA, you'd use 'r' to reply to the author
or 'R' to reply to the author and the list.

If you find yourself replying to 'mailfail@ucsd.edu', your mail user
agent is misconfigured and needs to be fixed. 'mailfail' is the error
address where undeliverable mail goes - and it's mostly a bitbucket.

Our list handler software is being revised and will, we hope, soon be
able to filter out administrivia like subscription requests that fools
send to the list instead of the admin address. It doesn't do that yet
but we're actively working on it.

Digests are issued about 4 am Pacific time each day that there has been
any traffic, and additionally whenever 32kb of mail has accumulated.
They'll be archived on host FTP.UCSD.EDU in the /mailarchives directory,
just like all the rest of the digests we issue.

Have fun!
- Brian

See you on the list.

I wouldn't worry about it anyways, wether he has sold the stuff or not...
I offered to buy something from him, got an e-mail committment and went
off and got a money order to send him (within 48 hours) and next thing
I know he's e-mailing me that some other ham sent him a money order
(Totally unanounced, Yeh right!) for the item so therefore it was sold....

So much for keeping ones word......

I don't think I would consider it much of a loss really, if the above is
any example, then what you bought might not be what you expected...that
tends to often be the case when you buy from these kind of folks.

Yeah right!... I'd like to see that radio.... you've got your
radios/mods mixed up... that was the TH-78 that could recieve
cellular.

1893. Recommendation for CW Key

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-22 00:00:00 UTC
From: Douglas Gavilanes <gavilan1@earthlink.net>
Message-ID: <32E5E648.49CB@earthlink.net>
Source record: 185387

I'd like to get some comments regarding the type of key people prefer for CW operation. I am currently dealing with speeds of up to 13-15wpm, so it doesn't need to be the lastest hi-tech device or PC interface. I just want to buy a good manual key, and want to know what to buy - tomorrow is Saturday here and the candy store is only available to me on Saturdays (they close too early during the week for my taste).

Any help appreciated.

1894. Info on hamshops (and rigs) in San Francisco area?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-22 00:00:00 UTC
From: oh2kku@iki.fi
Message-ID: <32e686bd.17773317@news.netlife.fi>
Source record: 185388

Hi, thanks for reading this...

I live in Finland and my father is going for a 2 week business trip in a few days to San Francisco and as the radios seem to generally be cheaper in the US than here, he might be bringing one back home with him.

The radios I'm mostly interested in are IC-706, TS-850SAT. FT-900(C)AT and possibly TS-570D/S. These aren't excatly wrestling in the same class, help me, do I want a mobile rig or a fullsized one? What are generally the biggest differences (besides size/limited number of keys&knobs) between mobiles and fullsized rigs? I probably won't install the rig to a car, at least not fulltime (for some long trip maybe). Maybe some portable use.. Mostly at home anyway.

What are the current pricings and are there any special deals on these rigs currently in SF area? Addresses/phonenumbers to hamstores in the area? If you have other suggestions for a good hf rig, I'd like to hear them too. 6m isn't a must, but it would be nice.

The 2 meter band on ic-706 looks like a nice addition too, but is the radio harder to use via all those menus than the fullsize 'tablerigs'? Somebody told me that without modifications the receiver is quite dead on frequencies over hf, excluding the 6m & 2m hambands, is this true? Does it listen to ula and 137 MHz wefax good enough without mods?

I haven't worked too much on hf yet, is tuner a must on hf? IC-706 doesn't seem to have one internally, what does an external auto tuner for ic-706 cost?

Does the DSP in 570 make a difference compared to non-dsp rigs? I've heard rumors that ts850 has a really good receiver, is this true?

Important for me would be to know if these rigs are (easily) modifiable to the European hf band table. I've heard that in some rigs the modification is just a matter of changing a right option in setup menu. Is this the case with any of those rigs I/you listed above? If not, can they be easily modified to work as European versions, for example like removing a diode?

Here's a table of operating freqs used in Finland, if they happen to match those of the US regulations (all power limits 600W unless noted otherwise):

1810-1850
1915-1955 60W
3500-3800

7000-7100
10100-10150 150W (only cw/rtty/data)
14000-14350
18068-18168
21000-21450
24890-24990
28000-29700
(50-52) 200W
(144-146) 200W
(432-438) 200W
(1240-1300) 200W

Source record: 185389

I also own an FT50R and really impressed with it, I even
put a mobile antenna and drove up next to a Los Angeles County
Radio repeater site that has many UHF/VHF transmitters.
My Kenwood/Icom HT's were bl;own away by the intermod, while
the FT-50R behaved great!!
The varactor tuned front ends on VHF and UHF really cut
down on intermod, as well as the new AGC in the IF. A real
design for the 21st century in HT's.
Has anyone compared the FT-8000 block diagram to the FT-50R,
do they have varactor tuned VHF/UHF front ends, how about the
VCO's are they similar or same modules.
I guess I am try to ask, If the FT-8000 was like an FT-50R,
but with a Power Amplifier, it would be a great mobile radio!!!
Maybe that was the thoughts from alot of Yaesu users out there.
If the radio is the same except for to much IF gain, maybe that
could be remedied.
Maybe I should buy another FT-50, and put in an external Power
amplifier in for UHF/VHF??!!
Any comments on the design, I am an EE in radio design here
for cell phones, and for the 1st time was impressed by the FT-50R,
and almost thought the same sucess story would follow the FT-50R.
If it is the same as the Ft-50R, then maybe less IF gain could
remedy the intermod issue, is it also varactor tuned front end
as the FT-50R .
I don't have FT-8000schematics in front of be to comment,
but have the service manual on the FT-50R to appreciate the
design!!!!

THe radio could be overloaded by FM broadcast, a simple
test would be to insert a high pass filter to to off FM
broadcast to see if alot of the problems disappear.
Anyway, I think some investigation of the front end filtering
to FM BC should be investigated, a simple fix could be implemented
if this was the the culprit.

>>Cough up a few extra bucks and have a Motorola radio (i.e. Radius
>>line) programmed for GMRS. You won't be disappointed...

You won't be disappointed unless you ever want to change CTCSS tones by yourself...or frequencies...or need an extra battery for less than 90 bucks each.

Is Motorola an excellent product? Absolutely. But I will take two or three Maxon 210+3 HTs for the same price as ONE Radius and have User-friendly front-panel repeater offset selection...User-friendly CTCSS tone-code selection which is FRONT-PANEL USER SELECTABLE for ANY of the approximately three dozen common tones plus another dozen extended and "in-between" tones, fifty in all.

You buy your Radius mail order - and who are you gonna call when you need it re-programmed?

Mike,
I also have a TH79AD and the FT50R, I like the FT50R since I can hear
my local fire dept above 500Mhz and the 800-900Mhz stuff.
I noticed that the TH79AD gets computer noise when on VHF, where the
FT50R does not. The first impression is that the FT50R does not get as
much intermod. But, maybe what we are seeing is that with multi-tones
in the IF of the FT-50R, that the AGC kicks in to desensitze signals.
this is not absolutely a bad thing, since with the computer next to the
radio, you may have 4 to 5 interferer signals hitting the just outside
the IF detectable(hearable passband).
When in normal situations, you may come across 1 or 2 interferer signals
to hit the IF and their total combined power would have to equal those
5 strong signals radiating out of your computer.
Anyway, I think you may be a little bit to critical in wanting
everything possible. When you start to consider what Yaesu did on their
Ft50R, I think they did a great job in design, given the constraints
og receiver image rejection, low current consumption in the squelch mode,
and less intermod(dependent of the number of Rf tones and their levels
in the IF.
An example is this, the FT50R has a known birdie mix to occur at
146.750 Mhz, when I turn on my computer, the birdie goes away. as I walk
away from my computer(which puts out garbage rf tones that fall into
the IF, the radio AGC's the RF to IFv gain level for greater attenuation.
This is great for not hearing the intermod, since the levels at the
final IF stage are reduced, causuing less chances of hearing an inband
IF mix product.
The counter side to this, in the presence of a strong signal(not
directly heard in the IF, but still detectable by the AGC, the radio
becomes less sensitive.
So in a low RF field environment, the FT-50R works great,
But in an enviroment with strong signals falling just outside of the
passband to be heard, the receiver starts to ALC causing lower
sensititivity(less intermod).
So if you have nearby signals falling into the IF, just outside
the shirts of the IF to de detected, your radio becomes less sensitive.
The the case of the TH79AD the radio does not ALC the same way and
weaks signals still pass thru in the presence of strong near band IF
signals.
Thus you may hear intermod products more likely to occur on the TH79AD,
these are my comments due to observations for VHF.
Yaesu may have incorporated this ALC trick to reduce intermod, but
on the flip side, when listen to a weaker station that the stronger
signal hitting the just of of the passband type signals, may appear
to be a form of receiver desensitization.

You probably noticed the FT50R sat there next to your computer
nice and quiet, like a deaf little mute thing, hear no evil,
speak no evil (evil - intermod) Anyway I hope you like the humor.
Yes, you right the radio goes deaf from probably 0.2uv sensitivity
to 2 uv , dependent on how much (total RF tones occupy the IF).
There is no big secret on how this try on ALC works, the threshold
of the ALC should be adjustable, but the onset could be more intermod
products to be heard directly.
I think thats the difference between the FT50R and the Ft-8000
is the threshold for the ALC.
If one were to defeat the FT50R ALC, you would noticed it would
work like the FT-8000 with having intermod everywhere. In order to
avoid intermod the back end , IF stages would have to have high P1dB,
higher Ip3 intercept ability. Usually IF stages with High Intercept
points draw large amounts of current. The squelch stagby current could
easily go from 20ma to possibly 80-100mA to notice an improement in
third order intercept.
The next complaint would be that the radio consumes too much power
and does not last to long.(less talk time) for the user.
You could defeat the ALC , but this could turn your FT50R into the
terror of the night of receiver like the FT-8000.
So , I hope you see, you don't get something for nothing.
More Dc power for higher intercept(less intermod).
One possibility is to have a narrower IF, but that means
more filters in a radio that is highly packed.
If you have designed, built receivers, you can appreciate
and the pain it takes to build such wideband receivers.
The TH79AD stops at 470Mhz because it primarily had poor
image response above 470Mhz , you could hear some ham repeaters
at the image frequency = (2 * LO freq) - RF freq.
Anyway the 2 stage varactor filters really cut down on the
image reponse to allow for wideband receiver performance on
both VHF/UHF.

Just getting into ham radio... passing my Tech-Plus a week ago
(but still awaiting my callsign - *sigh*)
I need to swap or sell some of my other toys to get started!

Here's what I've got:

386SX/16 Packard Bell Computer, has math co-processor
130 Mb Hard Drive
3.5" 1.44Mb and 5.25" 1.2Mb floppy drives
4Mb RAM
2400 baud internal modem
14" Color VGA monitor included!
Keyboard, mouse, DOS, and Windows 3.1
--- Looking for $225.00 or swap?

Tandy 1400FD Laptop Computer
8088 based, CGA backlit B/W LCD panel
2 - 3.5" 720K Floppy Drives (one is inop.)
Good NiCad, Adapter/Charger, Orig. disk, manuals, box!
---- Looking for $125.00 or swap?

Genius Scanmate/256 GrayScale Hand Scanner
Has SmartPage OCR, PhotoFinish 3.0, and MediaMate software.
---- Wanting $40.00 or swap?

Wang #9648/24i Modem
2400 data, 9600/4800 fax
Original manuals, software, box.
---- $25.00 or swap?

Also a good bit of software... Flight Sims, Games, etc. too numerous to
list.

Say brother and sister, could ya help out a newcomer? Prefer to get
started in 2 meter or dual/440. What have ya got? Make me an offer!
I'm located in NE PA, could meet with equipment if not too far.

Thanks in advance!

2-Relm WHS450 Portable UHF tranceivers..
These are 4 months old, used very little in perfect condition.
4 watt UHF, 16 channel programmable. Features include,
CTCSS tones, DTMF tones, scanning, priority function,
wall charger, belt clip 700mAH 10.8V battery. Small
but very durable. Freq 450-480 synthesized/programmable.

These radios are Great. I have 4 of them but I have
just gotten my Tech Plus amatuer License and I am looking
to purchase a dual band HT and a dual band mobile.

I paid $525.00 each for these in the fall and I will let them got
for $450 each or $875 for the pair plus shipping. Boxes and
manuals included. Will consider trade for dual band 2m/70cm HT
and/or Mobiles. If interested email me @

> BOX). SBFFT is like this.

The "other" problem is that Win95 still seems to "own" the
soundcard when you are in a "DOS" box. The program does not like
that. You will get an "interrupt" error or similar.

Make sure himem.sys is loaded in your config.sys and "emm386.exe
auto" is in your dosstart.bat. Exit windows with the "restart
computer in dos mode" menu. You will then drop right into DOS.

I have had good success with it. It works! I got a perfect copy
tonight using a DX-440.

Pentium 120
S3 Vision 330 PCI 2MB
Soundblaster 16 value PNP
64 Megs RAM
Running Win95's stock EMM386.exe and himem.sys

640x680 and 600x800 worked fine, 1024x768 seemed to revert back
to VGA.

Unless you have a "magic" soundcard, you will probably have to
tweak the <esc>/Settings/Demodulator/Clock-cal setting.

Type <ESC> S D C

At first, I got a screen-full of scrambled lines. Totally out of
sync. Slowly decrementing the value, I got it to "straighten
out". It straightens out all the stored data, too. So the whole

image should "snap" into place.

My final clock-cal setting was 0.98698. You may need to step in increments as little as 0.0001 to "zero" it in.

Good Luck!

1923. Re: YAESU FT-8000 RADIO 'REPORT'

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-22 00:00:00 UTC
From: Michael Aust <maust21401@earthlink.net>
Message-ID: <32E6D3E1.5FF0@earthlink.net>
Source record: 185417

Mike,
One aditional comment, is that if the FT-8000 was near a computer, or a CPU device, you would hear birdies that that device, do you hear birdies with no antenna, that would mean they are generated inside the ft8000. I believe with all the interference you got , I would bet the source of birdie interference as you call was outside the ft-8000, showing how sensitive your ft-800 was in receiving!

any comments?

Good luck, Ken. Most of the hams I know of using 900 Mhz only use it for things like cordless remote operation of a base station on another band, or similar low-power applications. Since the FCC makes us share it on a secondary basis with pagers, cellular and cordless telephones, and since it is not an international band,(so satellites will ever be using it), and because of the power restictions, it seems to draw the least interest of all the VHF/UHF bands. Even the 1.3 Meter band is much more active. If it were ours alone, and they allowed us full power, it could've been the most popular ATV band. Especially since most US televisions already can receive it on UHF channels 70-83. It is good for a very local ATV net, but again, with pagers and all that junk being given priority use, and with us only allowed to operate under 200 Watts, it's not a very attractive band to spend money on. I wouldn't mind having a 20-30 Watt ATV transmitter and receiver on that band though, because I could use it for home video survailance... as long as I make it unkey rekey and ID every 9 or 10 minutes. That's not a bad idea, considering the crime rate in LA.

Have you tried Howard W. Sams for their PhotoFacts Manual? They have service manuals on just about any radio that has gone out of production.

I don't have their address here, but any service tech at a local shop should have it handy. I *think* their out of Arizona, if I remember right.

Greetings,

I am looking to add a signal generator and an audio generator to my test bench. I am looking for a clean unit with manual that would have a fairly wide range for general purpose use. A digital readout would be nice, but a fairly accurate dial would probably do. I would also prefer something with an adjustable calibrated output, but I have an open mind as too what I will condsider for purchase.

If you have something you feel I might be interested in, please Email me at my personal mailbox rather then posting it to this newsgroup. This assures that I will see your message!

Please state equipment model, price, and condition with any other relevent information. I promise I will respond to all email I receive.

Thank You for taking the time to Read and reply to my message.

Mike Drum, N2QAC.

Source record: 185428

My TS-950SD recently developed a problem that maybe some of you have run across in the past. Since the TS-850 is very similar, this would apply to the 850 as well.

With the audio volume at minimum, I hear a high frequency (7 to 10 KC) tone in the speaker and the headphones that is loud enough to be annoying. It sounds like a badly synchronized computer monitor. This sound changes when I adjust the brightness of the display. Since the display on these radios is switched, I suspect that the noise is coming from the display switching through the line that makes the beep tone. This radio beeps when you change modes.

The radio was fine a couple of days ago. So, something obviously has broken.

It is possible that the display computer is confused. Does anyone know how to reset this computer? Remove the battery perhaps?

Any help would be appreciated.

Thanks in Advance.

GEEZ! You actually allowed your XYL to TOUCH your rig? Isn't there an FCC rule against that,(even if she has a license)?

;-)

And now you want us to help you fix it, without so much as a promise that she won't do it again, huh?

I hope you at least got even by "accidentally" burning her favorite saucepan!

Try putting a sizable ground from ambulance body to the rack that
holds the receiver/exciter and expecially the pa/coupler. Without
the ground on the pa/coupler rack there will be no output.

I know this is probably the wrong place, but does anyone know of a company that is doing very small (i.e. in-helmet) recievers. I'm looking for one for a high noise environment. I'm not concerned about frequency, just that it be about 3" x 1.5" x 0.5" or so, and it only needs to recieve, not transmit. I've been looking for a couple of months, and no luck, so any help would be appreciated.

Hi Paul,

Can't help you with the speaker, but wanted to suggest you try a Deja News search under Yaesu 980...there was a gentleman on here a few days ago with a complete 980 setup for sell - maybe he'll split it up...worth a shot anyway...

Take care.

Scott,

I have owned 2 of them. I sold one last year. They work great and have all of the features I would need to use on a regular basis. The 30mW "Economy Low" power output comes in handy too when chatting localy, saves battery power and is better suited to comply with "minimum amount of power necessary" rule.. hehehehe

The only problem I have had with them is the display. I accidently dropped one and it landed, you guessed it, right on the display. The replacement part cost over $100 with shipping and all, but was rather easy to install. Otherwise, they have been really good rigs.

The squelch control is accessed by the menu system, which to some people that might be a bit of a drag, but I have had no problems using it. Crossband-repeating does not require turning the radio off and on, it's a simple 2 key command..

I'm not sure about the other radio you mentioned, but another handy little feature (used millions of times by myself) is the ability to lock the display light on. The keypad does not light up, but the display does. I have had other rigs that you either had to hold the lamp button in or the lamp would simply shutoff after a pre-specified length of time. Even if you turn the rig off and back on, the lamp will still be toggled on, so you don't have to turn the lamp back on again..

One other neat feature I take for granted is the activity lights on the top of the radio. There are 2 multi colored LEDs on top of the rig near the control knobs, one for each band. They are off when not in use, green when receiving and red when transmitting. When talking into the radio, you can see at a glance what the radio is doing.

Modification of this unit requires a very steady hand though. There are very tiny SMT diodes that heat up real fast and can be destroyed if your not carefull. The MODs rolling around the net are not very accurate since there are two versions of the TH-79 (79 and 79A). But, it can be modified easily enough, if that's what you decide to do.

The 79 was the first one in production, but there were complaints that the unit did not provide for a memory "lock-out" function, so they re-worked the keypad and the CPU and called it the 79A. Therefore, the mod does not cover the same RF territory as the MOD describes. The antenna is different from the 79 to the 79A as well, in that the 79

has a shorter, more stubby look to it. The 79A comes with a longer, sleek looking duck. When the 79 came out, the tone decoder was an option, with the 79A it came standard and is visible through the little black plastic cover on the right side of the radio (away from the PTT).. If you buy one used, make sure the tone unit is there.

If you get the 79(A), get the high power battery (costs less in the long run, and get the appropriate HT sheath (cover) for it. There are different size covers for the different length battery packs.

If you need any other information, feel free to email me.

There is a tiny PNP SM transistor used to switch the power. but I doubt
it's your problem.. try looking into the voltage regulators..

Will:
I have the Argo (the Scout's little brother) and think it's great. Very quiet, I actually worked Honduras on 5 watts. That may not mean anything, may just have been good propagation. The one thing that I dislike about the Argo (or the Scout) would be that the keyer has to be set each time you turn it on, it does not retain its setting. A small irritation, but otherwise an excellent rig!

Hi:
Has anyone used the above combination. As per the Heil Specs
the Impedence Selector on the Mic should be set at 500 ohms, but
the performance seems to be lacking. I have also tried placing the
switch in the 50k position and it seems to work much better. Any
help or comments on this matter would be greatly appreciated. Tnx

I'm also thinking about the FT-50. I notice that
the RX frequency range includes broadcast FM.
Since that is wideband modulation, is there some
provision in the FT-50 to demod it correctly?
What's the audio quality when receiving commercial
broadcast FM?

Best regards,

Marty Jones

1952. How works VSWR measuring equipment

Hello,

My name is Chiron and I'm a student at a Dutch school.
There are a lot of VSRW measuring equipment available in electronic shops,
but I can 't find books or other literature about the theoritical working
of those VSWR equipment. The prinsipal of VSWR is not a problem but I want
to know some implementations and how it works.

If you know some good books or publications please send me a mail.

Greetings and thanks in advance

Bob,

I also bought one of these when Texas Towers was
closing them out at $239. I noticed that the
softkey mod for extending the RX and turning on
the AM demod did not work per the manual.

Then I noticed in the manual that "some models"
would not do this function, so I posted a question
to my company's ham radio page. Another FT-2200
owner contacted me and said that I needed to cut
a green loop of wire that would be found on the
PCB after removing the cover and lifting out the
speaker. He said that doing this would also "open
up" the transmit band.

I have not done this, as I have been too busy to
pull the radio out of my console. I do, however,
believe the source was reliable.

Best regards,

Marty Jones

The Kenwood TH79 can receive 800-999mhz. Look at your schematics, the US version is missing 8 parts (they are all listed on the schematic). Add these 8 parts and then push the F and then the LOW button. Your VFO will change from 440.000 to 800.000.

The reception is very good.

Mike

Some of the posts in this newsgroup make no sense.

I will say that my FT-50R (I've had it all of five days)
does do an excellent job as a scanner. And it does it
superb job as an Amateur Radio transceiver, too.

Those postings to this newsgroup and to rec.radio.scanner
which cover the FT50R and are archived on the FT50R website
are *very* interesting.

And the power output on two meters is a watt or so more
than the first two-meter mobile rig (big box) I owned
back in the 1970s. Not bad for a radio I can slip into
my pocket.

1961. Kenwood TM-V7A Mic Control Troubles

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-23 00:00:00 UTC
From: peter.presti@oip.gatech.edu
Message-ID: <peter.presti-2301971815160001@imtcmac18.oip.gatech.edu>
Source record: 185249

I purchased my TM-V7A just before a 3500 mile road trip. Fun to play with. My problem is that the radio would occasionally act as if a random button was being pressed. I was baffled until an advertisement with lots of touchtones came through the stereo. The radio went crazy. The problem is that the microphone audio feed is always active. The radio decodes ambient noise as touchtones and generates phantom button presses.

Is there a fix for this?

Thanks
-Pete

Source record: 185252
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

My PK232MBX just stopped talking on the serial port the other day. I can cycle the power and the LEDs go through their normal startup sequence and it goes into the last mode I has it in, but nothing is transmiited from the serial port. I can tune rtty, and the tuning indicator work correctly. I thought it might have been stuck in host mode, but it is not (I sent it the proper escape sequence).

Any ideas on what might be going on? AEA, of course, is not around. Althought I heard someone purchased the TNC line from them.

Any suggestions for replacements? I work RTTY, AMTOR, PACTOR, and CW. SSTV, WeFAX and NAVTEX would be nice.

Thanks,
Kory

I have had dr 110 do the same things. Did you change the light bulbs in it? If so you probily blew out Q4 on the front board that turns the radio on. And probily burnt the trace also. I have one that was burnt so bad, I had to hot wire the thing on all the time. I got it at a ham fest for 30.00 so I can live with that. Alinco sells a service manual for about 15.00 for the unit. I dont have one but need to order one.

1968. FT-1000MP keyer

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-23 00:00:00 UTC
From: Murray Harris <mth2@nwark.com>
Message-ID: <32E80DFB.460C@nwark.com>
Source record: 185256

I built a memory control box, and it works fine except that I can not get it to send a contest number. The three keys which send the number, increment the number, and decrement the number work FB with the other menu choices, so it is not from a malfunction of the switch/resistor network. Too, the "tune" key works, but only as long as the key is held closed; it does not key the transmitter for the ten seconds called for in the manual.

Anyone else have this problem either with a homebrewed control or with the factory box?

Hi Paul, check out my web page for another idea in autotuners. I'm working on one that uses 4 relays and one variable capacitor. The 4 relays are used to switch in 0-15 ft of ladder-line to position the capacitor at the PC-200 point where a Parallel Capacitance will result in a purely resistive 200 ohms for a perfect match to a 4:1 balun and there's no lossy tuner coil anywhere.

as i see it, who cares how long it took...you gave your word and broke...
also judging from the number of people that have e-mailed me privately,
I was not the only person you committed something to and later stiffed.

I base alot of credibility on the fact that you never replied to my
e-mail back to you stating that I thought your practices unfair...

If you would like to dispute timeframes, perhaps I could post the
messages to and from you and I and let the net be the judge...I don't
think that from the time that you responded with the "its yours" message
at 8:24PM on 1/15/1997 to the sorry some other guy got it message at
1:24PM on 1/17/PM is quite 48hours, so how the F@#K was I supposed to
get a money order and get it to you in that time frame....sounds to me
like either a) as others have eluded you never had it in the first place
or b) you had already committed it to someone else and were just waiting
to collect from the first person who sent you a money order, maybe even
several people would have found there moey orders being cashed....heck
if this was the case then you must have a stash of Daiwa meters in the back.

Kory,

A few years back mine quit working also. I orignally suspected U19 and U20 (reference the schematic in the manual). I replaced them and it still did not work. Then I measured the + and - 10 (+10D and - 10D) volts going to U20 and found one of the voltages to be wrong. Traced back to the U13 circuit and found one of the diodes D3, D4, D5 (can't remember which one now) to be bad. Replaced the faulty diode and the TNC started working. My symptoms were that the unit would send characters on power up but would not accept commands. You may have to do some toubleshooting but it is probably in the areas discussed. Hope you find it.

Bill, Try looking around the inside of the unit for loose
or cold solder connections. Another pssibility is the Output
PIN diode (I assuming there's a solid state RF switch) may be
ready to go south. It could even be the inner workings of the
RF output device (bad bonding).

In other words to save maoney and possible grief look around
first.

See my earlier reply to someone else about how many hams try to cheat and rip-off each other by selling their old old old rigs for what you'd buy today's new rigs for, when the NO production grade model of radio is worth more than 50% of what it originally sold for, on the used market some 5 or more years after it was bought.

ATTENTION ALL HAMS AND EQUIPMENT VENDORS!

Dick,

This is either a Lightning Bug or a Champion model. If the vibration damper at the back of the bug is a sort of bridge arrangement, then it's a lightning; if it's just a post, then it's a Champ. I'd date it around the early 1940's.

From: Jim <jstrohm@texas.net>
Message-ID: <5c8fgh$124f@newsgate.sps.mot.com>
Source record: 185273

Absolute reliability?

Multiple identical units of a rugged, compact HF rig without too many
bells and whistles, operable from 12 volts. QRP and variable
TX power a nice capability. All-band RX is very nice but not
a requirement. If all-band RX, then all-band TX is icing on the cake.

Possible choices --
IC-730, IC-735
TS-430/440/450, TS-50
FT757

Since you need reliability through redundancy, I'd suggest rigs that had
been used but not abused, 2 to 5 years old. These should have the early
failures weeded out, but still have ample operating and shelf life left.

OTOH, if cost absolutely is no object, military and commercial all-band
rigs are an option. But I don't think you will be able to buy
true state-of-the-art comm gear, even if you could afford it.

What paramilitary separatist survivalist group did you say you were
with?

1986. FS: REPEATER CONTROLLER WITH PHONE PATCH

For Sale,
Hamtronics Repeater Controller with AP3 Phone Patch. All in good
condition. All you need is a simple transmitter and receiver. The
controller also has a port for an auxilary receiver, good for linking
to another repeater. This controller was factory built, not a kit.
Comes complete with owners manual. Price is $200 shipped.

I have two FT-8000's and they are great. I also have a TM-742 which you mention and found it to perform about the same as the FT-8000's. The only time I get wiped out is when I run up alongside another ham running 50 watts.

I would guess that you have some other kind of problem there, perhaps an antenna problem or intermittent coax due to internal break of the center conductor which can cause these kinds of problems.

equiptment is as follows:

YEASU FT-101-EE- in perfect shape, non smoker, still has factory plastic
on
face, finals in very good shape, comes with
2-new finals in the boxes too.
YEASU FR-101 communications reciever/ vfo/ 6-digit freq counter.
this
unit has 6, and 2 meters in it as well as
10,11,13,15,16,19,20,25
31,40,80, and 160 meters. and this unit
works
as a vfo when
used with the FT-101 with a 6 digit counter!
has the factory
plastic on the face still! perfect
condition.
YEASU YO-100 matching O-SCOPE with factory plastic on still. works
great.
will also let you monitor the patterns on
rx.
YEASU LANDLINER phone-patch unit in matching cabinet, works great.
YEASU EXT SPEAKER matching ext speaker
ASTATIC SILVEREAGLE this mike goes with this package.
I have all of the factory owners manuals in superb condition, with the
factory schematics. also, i have some of the origional boxes, and some
custom
slip covers for them. PACKAGE ONLY, PLEASE,,,,850.00 PLUS SHIP

GLEN CUSTOM 1600 in perfect shape, uses 4---4cx250r tubes. variable
output.
have the origional owners manual, and
schematic.NOT A
SCRATCH ON IT. 1000.00 + ship

DRAKE RCS-4 remote coax switch box, 5-position. have origional paper
work.
55.00 + ship

ASTRON VS-50-M 50 amp power supply, with amp & voltage meters. variable
voltage adjusts from 2 volts, to 15 volts
externaly. in perfect
condition. 200.00+ ship

YEASU G-800-SDX very nice rotor. 21 sq. ft. load rated. rs-232 input
for

computer control. only 4 months old. have all paper work.

I'd like to run an old landline telegraph sounder off the CW from my rcvr, and I'm told that a RTTY converter or terminal unit will do the job. Since this is just for fun (so as to hear the clickety-clack of a LL sounder) I'm looking for bargains only... (CHEAP HAM alert!)

73 from Hawaii,
Jeff KH2PZ

That is an amplifier that was built as a (very dark) grey-market
product for the CB field ... never marketed in the amateur market. It
may show ham bands on a bandswitch, but ...

If you have a CB shop in your area that sells such items, you might
check with them.

Good luck in your search!

A few questions on the fine points of weather satellite image reception...
(on a shoestring budget.......)

I have read the article in Nuts and Volts, picked up the LM741 fuzzbox interface for my Pc (it does reemble a crude guitar fuzzbox effect...what an odd way to get square waves!!!!)

My ancient heathkit GR-64 has a BFO, am bust dusting it off, Won't hook the mess up until I get an isolation xformer for the patch...

AND.... Tadah.... just scored an ancient Radio-shack PRO-33 20 channel scanner for that all-important 137 MHZ reception... As the scanner tunes in 5KHZ steps, it might even tolerate the reported doppler shift...

SO......
1) Assuming I find an antenna, will the little 741 interface and the shareware program for weather fax I got with it do the job for 137 MHZ reception ?

2) the Nuts &volts article has a diagram of a double crossed dipole antenna. Bottom cross must be grounded as "reflector", right? Top one is PVC and wire along the sides, just like the ancient RLL handbook design... OK. but what length??? The formula in my 1970 Arrl book doesn't look too useful over 50MHZ or am I banging the calculator wrong???

Any suggested lengths???? Got baling wire o plenty...
(then off to the cable co dumpster for coax.... and away we go...)

3) I am really interested in the High Orbit 1691 MHZ sat images... But that $US600 downconverter.... ulp...
On the other hand, I garbage picked an old sat reciver a while back (swapped it off.... they aren't worth much if they don't de-cypher) Now.... hmmmmm..... Conversions anyone???

3B) Those really cheap mini-sat disk systems being sold to hook one in to paying subscription fees forever.... wonder how modifyable these are....

Ok...at this point my ignorance is REALLY SHOWING, but heck... one week ago I was ripe for a Ramsey 137 MHZ kit (fortunately I am perpetually broke), and then I pick up the scanner at a 2nd hand store for CAN$30.... As a bonus, I get to hear the

walky-talkies at macdonalds 4 blks away (YAWWNNNNNNN!)

This sat stuff looks great.... (I used to mess with
electronics and DX a bit, went to University, got useless
degree, decided to have FUN, went to ART school, got a REAL
USELESS DEGREE, and now do gallery sized set-ups involving
wonky technology... Still can't draw worth a %$&....
So what If I recycle a few sci-fi plot lines here and there...

TRY this....
Sat receiver => computer => stored images scripted to slide
show mode, adding latest image to end => cheesy VGA-2-video
coverter => rented scan rate doubler => rented video projector
high up projecting on the floor of a darkened room...

OOOOHhhhh..... View from a height....

The pro sat pictures from high orbit would be best, but the
low orbit ones are a good start...

Any tips, sites, advice, apreciated big time...
Thanks & regards.... B/H

I've got an Optoelectronics Scout for sale. It's a scout model 25 with a frequency range of 10Mhz-2.8Ghz. It requires a CBAR interface to interface to the AR8000 and 2700, and I have and will provide this also. It's in good shape and works well, I had it recalibrated and cleaned at the end of October 96.

I'm asking $300 for the Scout and CBAR Interface, please e-mail me at mwaldron@ohio.net.

73's de Mike.

Maybe a valuable lesson could be learned from this Mike - next time you
want something, instead of "thinking" about it for 48 hours, you should
go out and get it...

Another gentlemen beat you to the meter - it happens. The world doesn't
stop and wait because you're "thinking"...

Take care.

Geez...it's really ridiculous to tie up the conference with this
stuff...

As I said, almost all of the equipment has been sold - so MOST people
are familiar with it.

To give long, detailed descriptions on every piece of gear would simply
take too long and way too much conference room...my particular add would
have ended up being several pages...

I clearly stated "inquiries welcomed"...if you had specific questions,
all you had to do was ask via E-mail.

In a few years, most of the items I listed will be just as familiar to
you as they are to the others who read this group...in the interim, it's
un-reasonable to tie things up with un-needed "fluff" descriptions.

When reading the conference, I see some items that I'm personally not
familiar with, and if interested in the item, I ask questions (via

E-mail of the gentleman who's selling it) or I hit the enter key and go on to the next. I don't try and impose my own personal level of knowledge (or lack of it) on the group and ask that adds be written to MY level of expertise.

To sum, you write your adds, and let the other people here write theirs...seems fair to me.

Take care.

John

2012. WTAB: Dayton Wish List.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-23 00:00:00 UTC
From: Gabe Nemeth <gabe@bnr.ca>
Message-ID: <32E77138.1522@bnr.ca>
Source record: 185313
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi;
Some of us HAMs are going to be fortunate enough to be going to Dayton.
I thought that these news groups could be used to make contacts for
'that
special item you are really looking for'. This may save the potential
purchaser and seller some time. With that in mind and the permission of
the
group let me suggest that you post:
1. what you want,
2. What time you'll be there,
3. and a Freq., or booth# to contact the vendor - simplex.
4. With no disrespect to large vendors this should be limited to smaller
'flea market' items.
5. WTAB: = Wanted To Buy At Dayton.
- - - - -
Cheers, VE3SLJ. Gabe.

Let me start:
1. 6M SSB transceiver.
2. HeathKit Phone Patch Schematic for the older H101 radios
3. Used DAA for phone lines.
4. ~200Mhz Oscilloscope, recently calibrated. Must be willing to
demonstrate operation.
5. Used Freq Counter up to 2Ghz.
6. 70cm, or 23cm Data Radio's - for packet (preferrable tuning other
than replacing crystals).
7. used 70CM FMvoice pagers.
8. A dual band recceiver for P3D - this is a pipe dream right now,
but you never know.

I'll be monitoring the Dayton Call in for contact and we can switch
to a simplex freq. Or, by all means Email me at gabe@bnr.ca, or
gabe@interlog.com.

Cheers, and '73. VE3SLJ, Gabe.

->73 from Hawaii,
->Jeff KH2PZ

Jeff- -An RTTY TU would work, but there's an easier way. Build an active filter, tuned to your favorite audio frequency for listening to CW, and feed its output to the base of an NPN transistor. Use a series diode to rectify the audio and a cap to smooth the DC a bit. The emitter of the transistor goes to gnd, and the collector to one terminal on the sounder. The other sounder terminal goes to whatever + voltage required to smartly pull the sounder bar down. Connect a snubber diode across the sounder coil to quench the voltage on release.

I built just such a circuit several years ago. Used the output to trigger an audio oscillator. This gives the advantage of hearing nice clean CW with most of the QRM removed. If you make the bandwidth of the active filter very narrow, noise and other stuff won't trigger the sounder.

E-mail me if you'd like the circuit.

Anybody got any comments on the Radio Shack frequency counter?

I'm looking for one and theirs seems to be one of the cheaper ones
(they currently have it on special at $30 off).

reply be email to ddenter@ottawa.com and I'll summarize.

regards,
Dean.

Hi Mike,

You might look at the Sangean line of short wave receivers. The 818 model has pretty good sensitivity, good receive audio, and a BFO for receiving sideband. It covers 150khz. to 30 mhz. They are in the $175.00 range for a new one and have direct keyboard entry for frequencies. Amateur Electronic Supply in Milwaukee,Wi. is a mail order service @ 1-800-558-0411. Another good mail order place is C-Crane Co. @ 1-800-522-8863. You might call either one of them.

Buy or borrow a good straight key. The common one with the little ball bearings for the pivot, or the $3 CPO key are not a good choice because the spring is much much much to strong. I prefer the military surplus key with the leaf spring, but have some other decent keys with soft springs. The cheap spring will tire you out in just a few minutes, or give you cramps, and not let you send well, as well as reduce your enjoyment.

I have modified the cheap keys in 2 ways that made them usable, the first is to take a spring from inside an FT-241? crystal, anyway the crystal holder with the 4 screws on the front. The other method I epoxied a small rare earth magnet on the back of the swinging part of the key, and a small plate of steel on the base, made a fairly decent feeling key.

I personally do not like the double knob key, but know many who do, that is up to your own choice. Read a book on the appropriate posture for sending, it will really increase your enjoyment, and make your fist sound better.

Have fun, you will meet a lot of really nice guys on CW.

I have a '706 and the ICOM AH-2 autotuner (left over from my '735), this combination works fine except the autotuner is disabled on 6 meters. I don't know if it would actually work at 50 Mhz. but it seems like it would be worth a try. I have the external control head from the AH-2, when the weather inproves I'll give it a test to see if the tuner can handle 50 mhz, any suggestions on how to enable the tune function in the '706 ??
Thanks, Jim WA1GPO

Thanks for an informative post, but I think you got the model numbers wrong. The original version without lockout was the TH-79A. The revised version is the TH-79A(D) (the "D" stands for "Delux"). There is now another "version", the TH-79A(DH); it's the same as the -79A(D), but ships with a higher voltage battery allowing higher max transmit power.

>failure...

We all have to start somewhere. What this proposal gives us is a
much larger base of potential experimenters because it doesn't
require the purchase of specialized single purpose hardware. A
person can first learn C programming, if necessary, before tackling
DSP because the hardware doesn't demand that the person start out
immediately coding DSP applications as the specialized hardware
platforms do. This allows the non-specialist to gradually acquire
the necessary skills, IE work his way through the "hello world" stage
without the double compexity required to do anything with dedicated

DSP hardware. And most DSP algorithms don't require advanced coding
tricks anyway, so a detailed specialist knowledge of the programming
language isn't needed to do useful things.

>>The hardware base suggested is sufficient to achieve markedly better
>>performance than most available hardware solutions for *voice grade
>>radio* use, and likely better than some dedicated platform DSP solutions.

>Given the time that DSP cards are available to amateurs now, I am no
>longer that optimistic about what they are going to do for packet radio
>modems...
>(of course I was enthousiastic when I first heard those lectures about
>experiments with multitone PSK modems, but where are they now?)

Two points. How many DSP-4 cards and TAPR DSP-93 cards are in the hands
of experimenters? I'd suggest only a relative handful. Now contrast that
to the number of sound card equipped PCs in the hands of potential
experimenters. I'd say that at least an order of magnitude more people
would work on a sound card application than have been working on the
dedicated DSP platforms, if a skeleton framework of code were available
for them to use as a starting point. That would be the task of the initial
group we are talking about forming for this project.

Second, multitone FSK faces a regulatory barrier here in the US which
has inhibited its full application. The best known systems require at
minimum 2 kHz of bandwidth, but we are limited to 1 kHz by regulation
for HF data modes in the US, 500 Hz if the station is automatically
operated. (Multitone doesn't offer us any useful advantages at VHF and
above for terrestrial work, though it does offer promise for EME, and
some work is being done in that area here.)

>>This shouldn't be looked upon as a method to achieve higher UHF+ packet
>>speed. This is intended to improve average performance in the low to very

>has only increased over time while we were kept at the same 9k6 rate)"?
>Of course I know some explanations for that, but not all of them are
>completely unsolvable.

The problem is mostly one of how to achieve successful training in
a contending simplex environment. If we want to go to nailed up
non-contending duplex links, we can just adopt telco technology.
That's basically a solved problem. All we have to do is throw off
the shelf radio hardware at it. With the available UHF+ spectrum

we have, however, it is more cost effective to use a dedicated RF
modem with a less sophisticated modulation to achieve high speeds.
For low SNR paths, however, we have scope for development of DSP
solutions, at necessarily lower speeds, Shannon won't be denied.

>We (in the Netherlands, also in the rest of Europe?) at least seem to
>have the regulatory advantage that we have no bandwith or baudrate limit

>Nice to have one advantage over the USA, where a super-ego (who once,
>long ago, lead the BBS software field, you probably know him) is trying
>to condemn any limitation to hamradio message content or source
>identification found in other countries as censorship :-)

Well, I won't touch the latter topic, but I'm glad to hear that
you have no artifical baud or bandwidth limitations. Below 33 cm
we do. And they are particularly onerous on HF where we are limited
to 300 baud and 1 kHz bandwidth (500 Hz for automatic operation).
Above 33 cm, we also can use any baud and any bandwidth which fits
inside the amateur band.

2030. TS-570D-happy owner

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-23 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <854045363.12957@dejanews.com>
Source record: 185331

Hello,

Since I had posted several messages asking about features and other aspects of the Kenwood TS-570D prior to buying one last Sunday, I thought I'd come back one more time and chip in with my two cents' worth now that I've owned the radio for several days.

The TS-570D is everything I hoped it would be, and then some. It's got a fantastic receiver and the AF DSP filters work extremely well, expecially on CW. Using the CW TUNE feature along with the DSP filter bandwidth selector, you can crank the CW bandwidth down to 50 Hz with little or no ringing. As far as the TX audio is concerned, I've had several comments from hams both in my area and in other states (and one DX) tell me it's excellent.

The radio has a CW feature that I'm surprised wasn't mentioned in QST's product review or even on the newsgroups: The CW message memory keyer (which has three channels that can store up to about 50 characters each and can be stacked) also has a repeat function that allows you to set the break-in, touch one button, and the TS-570D will call CQ for you, pause for a period of time *you* select from 1-60 seconds, and then call CQ again! Yeah, what a lazy, couch-potato way to call CQ, but think of all the uses for this *standard* feature in contests and Field Day! It'll keep retransmitting your message, waiting in between transmissions, until you hit your paddle or the "clear" button. Once you've set the menu items that specify this function and the delay time between repeats, you just have to hit one button to repeat this function.

The rig's heatsink is massive; it's basically an aluminum "case within a case." The rig is so well-shielded that you have to remove an entirely separate cover (with 12 screws, I might add!) once you've removed the outside cover of the radio! The rig hardly got warm to the touch during a good 2 hours of full-output CW the other night. Heck, it took me two days worth of making sporadic contacts before the cooling fan ever came on! (And compared to the FT-890 I've been using, the fan isn't loud.) Heck, the fan's enclosure is even molded into the cast-aluminum rear of the radio. As the owner of three earlier Kenwood HF rigs, I have to say that by far, this is the best-built Kenwood I've *ever* seen.

The manual is thick and very user-friendly, although I must say I wish Kenwood would stop printing their manuals on such flimsy paper. I've almost ripped mine after a week's reading. That aside, it appears by the charts, diagrams and just plain easy reading, Kenwood is trying to be really impressive with everything having to do with the TS-570D.

The built-in antenna tuner is also impressive. It has no motors but instead uses relays to do all its matching. I was skeptical of this, but the rig sold me! The only antenna I have connected to one of the rig's *2* antenna ports is a half-wave 80-meter dipole up about 25 feet. (Hey, I live in a townhouse -- have to do what I can. You should be impressed I was able to put an 80M dipole up at a townhouse!!!) It's fed with 75 feet of RG8X coax. I haven't tuned anywhere yet (even on 160) where it can't find a match.

The LCD bar-graph meter displays three sweeps *simultaneously* while you're transmitting. Normally it displays RF output, SWR and ALC. If you turn on the speech processor, then the SWR section disappears and a COMP LEVEL section appears, giving you COMP LEVEL, RF output and ALC simultaneously. One negative comment here -- you can't turn off the "peak-hold" function on the meter. I didn't particularly want to see the highest segments hold for 2 seconds, but I'm getting used to it.

Here's another interesting tidbit that's probably useless, but it's interesting to show other hams as they drool over your new radio -- the display dimmer has five levels, the lowest of which turns the backlighting completely OFF! Not that you'd ever really want to use that setting, but it sure makes the display look wild!

I like the fact that Kenwood is finally starting to implement an RIT control that acts like Yaesu's CLARIFIER control. My earlier TS-850S had an RIT that only varied 1.2 kHz either side of center. The TS-570D's RIT control is continuously variable over a 9.95 kHz range either side of "center" with a CLEAR button.

To make an extremely long post come to an end, I'll summarize by saying that for the money, the TS-570D is the best deal in an HF radio I've ever seen. (I've been a ham for 15 years and NO, I DON'T WORK FOR KENWOOD even though it may sound like it from this message!) I'm just thoroughly impressed with this radio. It's easy to use yet PACKED with features. I've heard people postulating that it may come down in price a couple of hundred bucks in the next few months. Well, if you can get one for even cheaper than the $1499 I paid for it at a local hamfest, that makes it an even more amazing deal.

Now, if it'll just hold out for the long haul ...

I'll be happy to answer any questions, aesthetic or technical,
about this radio.

73,

Meade, KA4RQB
Richmond, Virginia

Unfortunately, what you say is true (especially the bit about Dxers
inappropriately using an amplifier). That reflects the Dxer mentality
of competition rather than cooperation which is so antithetical to
data networking. There is also the fear (legitimate in some cases)
of missing a spot because of lack of positive acknowledgement of
delivery. Failing to achieve timely delivery is a fatal flaw for
this application, so the connected mode has value even though it
is wasteful of channel capacity.

>>And typically, a BBS will download the same bulletins again and
>>again as each user logs on and reads them. That's also very wasteful.

>popular before that.

Well, I think it is chicken and egg. If there are no applications
requiring multitasking capabilities, people won't be motivated to
switch from their old single threaded systems. Linux has removed
the excuse of cost, but it still seems complex to someone not familiar
with it.

>An other problem with the BBS forwarding traffic is that no one is

>For this type of operation the asymmetric end user connection would be
>preferable.

Yes, I agree to an extent, though I do see users reading every new
message on a BBS every time they connect. I don't think many of the
users around here have gotten selective in what they download. Thus
your proposal may not represent any resource savings at all unless
those habits change.

I have a Icom 720a hf rig that I would like to sell or trade for a 2m all mode. The rig is in mint condition and I have all the manuals. It comes with the matching speaker, power supply and desk mic. I would like to trade for ether a Kenwood 711a(with tone installed) or a Icom 275 but I'm open to others. I
live in the Chicago area and would deliver within 80 miles. I would prefer to do
this locally but would ship out of state.

The price for the radio without trade is $550 firm. Please E-mail for more info.

Some guys actually have a file cabinet with each and every catalogue available. I don't, and I would thus concur to the notion, that sellers should tell a little more than just make and modell. I vividly recall when I was a newbie and had no idea with most of the For Sale postings, what exactly was offered there.

Those, who post just make an modell actually ignore the market segment which has the most potential buyers: the newly licensed radio amateurs, for whom just make and modell still is Greek.

Sellers, think about it. The ones who actually want your stuff are out there, but they may not know, that what you offer is what they want. Unless you tell them.

Dear OM's:

My station is empty but an ICOM R-71 right now. H&R Block told me that Uncle Sam is going go reward me a station for saving money dilegently into HIS savings account. Therefore, I am now in the process of building up my casual FM/PACKET VHF/UHF base station. However, I am struggling between the following obvious and stupid options:

(a) 2 Mono banders and 2 antennas.

(b) 1 Dual bander and 1 antenna.

(c) 1 Dual bander and 2 antennas.

(d) 2 Mono banders and 1 antenna.

I like option (a) but it looks like the choice of 70cm mono is very limited.

Is option (b) a winner to many of you?

I also like option (c) because I can have some higher gain antennas (cheaper too). But this configuration requires a duplexer that I don't know even if it exists.

Option (d) sounds like a "Do"able option. Is there anything bad about that?
Which duplexer is good for this configuration?

Your input is very valuable so please response via newsgroup or e-mail.
Thanks in advance.

Very 73!

....snip

I'm really confused, help me understand what is going on here.

Have I been wrong when I always assumed that first come first served meant who ordered first and got a commitment could plan on the item being held until payment was received. Even if payment was not received in a day or two, an e-mail to check status would be expected.

If you tell someone they have the item and to send money, then why would you tell someone else they could buy the item if their money got there first? This sounds very ungentlemanly, if not just plain unethical.

It is shame you both don't live in Texas where a verbal commitment of this type is considered a binding agreement by the courts.

I would like to know if this is how most people operate, or if this is an exception. I buy a few things on the net, but appearantly not hot items. I sell things, and always follow the rule, once a person says they want it it is theirs. I do have difficulties because of my travel schedule and the post office schedule of getting items shipped, many of the people I sell to have to wait a month or more for me to get a chance to mail it, for this reason I don't request payment until they get the item. There is a couple of items I have never been paid for, but I figure the guy will remember it every time he uses the item, and if he can live with that, it is OK that is their problem, I would probably feel different if

"THIS WASN'T JUST A HOBBY!!!!!"

Take care,

Glenn Sparks KI5GY

Sort of makes you wonder, if they didn't
even intend for the reception to be decent, why
d0 they include and advertise this
capability. It's not like there's anything else
you can listen to in the broadcast band.

That is really great! I have two TM733's and a TH-79, and have been
wondering about a clone tone option. It is always nice to see someone
taking the initiative to homebrew, especially when it comes out ahead of
a company product. I imagine that the folks at KW are going to be
scratching their heads wondering why they can't sell their clone product.
Not that I have anything against KW, I bought three of their dual band
rigs as well as my TS-140.

Thanks,

Ed Burress

Thanks for the timely responses from FT-50 owners.
I didn't expect that the fidelity on broadcast
would be good, unless Yaesu had specifically gone
to the trouble to address wideband demod. It
would certainly be handy on camping trips, though,
to not have to carry two radios.

I have also seen several references to a "freeband
mod" for the FT-50. Have any of you done this,
and what capability does it add?

Best regards,

Marty Jones

>
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
The APT signal is about 38KHZ wide, so the scanner
won't yield a useable signal until it's modified.
Usually a resistor across a couple of the IF ckts
will lower the Q enough to get by. You might have
to change a filter. Either way, the signal to noise
ratio is degraded by increasing the bandwidth, so
a pre-amp at the antenna will be helpful.

>

Yaesu sez:

INFORMATION REGARDING CONTEST KEYER OPERATION TNX INFO FROM N9CGD

The FT-1000MP Operating Manual's explanation of Contest Memory
Keyer operation may be somewhat incomplete. Please observe the
following notes regarding Contest Memory Keyer operation:

1. Use the "Iambic 2" Keyer mode (Menu Item 7-0).

2. The so-called "CQ Message" (activated by Key #1) is the message slot
which must be used for generation of a contest serial number (e.g. 599
001, 599 002, etc.).

3. To imbed a contest serial number in a message, insert four question
marks ("????") at the point in the message where you want the contest
number. Four digits will not necessarily be sent, depending on whether
you have three- of four-digit contest number playback selected via
Menu
Item 7-6. But you must send four question marks (not three) to imbed
the
contest number correctly.

4. A contest number will not function in the "MSG 0" ~ "MSG 3" slots.

2066. Re: Yaesu FT-50R

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-24 00:00:00 UTC
From: ldworkin@primenet.com
Message-ID: <32e9016b.13670614@news.primenet.com>
Source record: 185208

I spoke to Yaesu about the WFM feature. I was told that the FT-50R was designed in Japan. No surprise there. WFM was designed with the Japanese broadcast FM requirements. I was told that the Japanese WFM is narrower than the US WFM for broadcast. Therefore it works fine in Japan. So if you really want to Rx WFM broad cast you must travel to Japan.

I asked about a mod to widen the WFM filter. I was told that the radio didn't have the room to change/mod the WFM filter.

The only reason WFM is addressed in the manual is because they didn't want to design two different radios. One with WFM and one for the US market (with-out). Therefore since would be in the radio they decided to include it in the manual. (Of course we would all be asking about the feature if it wasn't documented.) The manual was translated from the Japanese version. They had meant to include a note about the WFM not performing well in the US version.

So, what do you all think about this information?

Can a modification be designed?

> Is there a fix for this?

My '733 with the old MC-45DM microphone does this also. Kenwood has a
mod sheet out on how to fix this problem (by adding a transistor.)
Check it out at
ftp://ftp.kenwood.net/pub/Amateur/Amateur_Application_Notes../aan0003.jpg

The only problem is, nobody seems to have the special transistor that
Kenwood wants
you to use! I haven't tried the mod yet, but I might just try a normal
NPN transistor and see how long it lasts.

Good luck!

Sounds like you've lost a RS-232 line driver chip. A quick look
with a scope or logic probe will tell you. DigiKey stocks the chips,
the repair is simple. If your setup is subject to surges, you might
want to install a socket for the chip because you'll be replacing
it again.

Hi Bill,
While this is probably not all of your problem, we have discovered 4
FT736's and a 726 that ALL share a common problem:
If you set the drive control at any setting other than full CW and let
the rig sit in RX. Within 15 minutes, pwr out will be down and continue
to decline. For example. I have set the power out on my 23cM module to
10W (full out is 12W). 15 minutes later it is at 8. 3 or 4 hours later
it will be at 2W. ALL the rigs did this on all bands. You can get back
to 10W by resetting the drive level- but it will change again. This
feature cost me a $250 23cM transistor.
The solution is to run the rig wide open and if you need less power
achieve it w/ attenuators or a suitable length of lossy coax.

You should post your inquiry to rec.radio.amateur.boatanchors You'll
find more info on Hallicrafters there. Good luck.

Look them up in the catalogue like the rest of us, smart guy.

2077. FS: YAESU FT-11R Micro Transceiver (handheld ham radio)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-24 00:00:00 UTC
From: "Keith E. Williamson" <kwilliam@halcyon.com>
Message-ID: <32E93A28.5A8A@halcyon.com>
Source record: 185219
Cross-posted to: seattle.forsale.misc,rec.radio.amateur.equipment

For Sale:

YAESU FT-11R, 2 Meter, 5 Watt, Handheld Ham Radio Transceiver.
In excellent shape (hardly used), with battery charger and soft case.
Purchased for over $325 over a year ago. Asking $150 or best offer.
An excellent, small, light radio for emergency use in the backcountry
(or car or home for that matter).

Will include the book "Now your'e talking: Everything
you need to get your first ham radio license" (reg $19).

Reply via e-mail to kwilliam@halcyon.com (I don't read these groups)

Specs:
Frequency Range (MHz): 144 ~ 146 or 148
Channel steps: 5, 10, 12.5, 15, 20, 25 & 50 kHz
Repeater shift: +/- 600 kHz (programmable)
Emission type: F2, F3
Supply voltage: 4.0 to 12 V DC
Antenna (BNC jack): YHA-52 Rubber helical
Case size (WHD): 57 x 123 x 26 mm w/FBA-14 (smaller battery than 5 Watt)
Weight (approx.): 280 grams with FBA-14 (smaller battery than 5 Watt)

Receiver:
Circuit type: double-conversion superheterodyne
IFs: 17.7 MHz & 455 kHz
Adjacent channel selectivity: >64 dB
Intermodulation: > 60 dB
AF output (@ 11.0 V, 10% THD): 0.2 W @ 8 ohms

Transmitter:
Power output (@11.0 V): approx. 5.0, 3.0, 1.5 & 0.3 W
Frequency stability: better than +/- 10 ppm
Modulation system: variable reactance
Maximum deviation: +/- 5 kHz
FM Noise (@ 1 kHz): better than -40 dB
Spurious emissions: >60 dB below carrier
AF distortion (@ 1kHz): <5%, w3.5 kHz deviation
Microphone type: 2-kOhm condenser

Well I've been around a few years, but ham radio manufacturers have been
around quite a few more. Rarely does a ham have catalogs from before he
got his ticket. And how about those who have just got their ticket in the
last 12 months... or are some of these sellers only willing to sell to
the good-ol-boys network?

> Those, who post just make an modell actually ignore the market segment
> which has the most potential buyers: the newly licensed radio amateurs,

My point exactly.

> Sellers, think about it. The ones who actually want your stuff are out
> there, but they may not know, that what you offer is what they want.
> Unless you tell them.

That's ALL I was trying to point out. But those who won't spare a few more
lines of text are those who dont really want a sale, IMHO.

For Sale:

ICOM IC-475H 80w all mode 70cm rig, in near mint condition, with manual,
stock HM-12 mic. $1100.

ICOM IC-275A 25w all mode 2m rig with built-in power supply,
near mint condition, with manual, original box, stock HM-12 mic. $850.

ICOM IC-551D 80w CW/SSB/AM 6m rig, excellent condition except for
scratch on top access door, with manual, original box, stock HM-7 mic.
FM board not installed. $450.

ICOM PS-55. Correct supply for IC-475H, but in the greenish color that
matches the IC-735. Near mint, with original box.
Can also run the IC-551D. $150.

All of the above for $2,450.

All prices include shipping.

Will consider any mobile or portable 6m, 2m, or 70cm SSB rigs in trade
towards above equipment.

I get birdies from cellphones. Have to unplug the thing to scan the
whole memory bank! I don't know if the cellphone is radiating on the
actual 2 meter freq or if it's an IF of the 2 meter rig, but it sure is
aggravating!

I've got one!

But, you are right, I think......much lower production than the A model.

Now for REAL low production, how about a 535B??? To the best of my knowledge, there was only ONE ever made..... And to answer your next question....nope, I don't have it, but I know where it is! ;-)

Fun to see conversation about these old scopes. Best built there ever was. Period. My favorites are the 555, 556, 549 and 547. INCREDIBLE displays that make modern stuff look like it's out of focus..... And tunnel diode triggering that leaves TTL in the dust.

> **
> MOST HAMS ARE FAMILIAR WITH THIS EQUIPMWNT.

Balogna. That's your opinion, but it has nothing to do with the facts. The FCC's statistical facts say that most of the currently licensed hams have had their licenses less than 5 years, so how could MOST of the currently licensed hams possibley know all the vital specs on models that were discontinued 7 to 10 years ago or more?

When you get your license, radio dealers and manufacturers only stuff your mailbox with literature about their CURRENT models, NOT about models that were taken off the market hald a decade ago. And you KNOW this is so!

rec.radio.amateur.antennas,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,news.admin.hierarchies,news.groups

I wish that I was the one to start these newsgroups. I'd have divided them up in better heirarchies like so:

To reduce the number of heirarchies in a newsgroup name instead of:

rec.radio.amateur.*

I would have made it:

rec.amateur-radio.

This is because discussions about scanners and broadcast radio and the like dont need nearly as many newsgroups as our hobby because our hobby is so much more diverse.

And for the *.antennas, *.equipment, *.homebrew, etc. I'd have made more spectrum-specific newsgroups to reduce the amount of unwanted posts we each have to comb through to find what we are looking for... Like so:

rec.amateur-radio.vlf-mf.*
rec.amateur-radio.hf.*
rec.amateur-radio.vhf.*
rec.amateur-radio.uhf.*
rec.amateur-radio.shf-ehf.*

And only for discussions on subjects such as the ARRL, the FCC, Newsline and all those which transcend all bands, only THEN you cut the NG name down to:

rec.amateur-radio.*

For example:

rec.amateur-radio.newsline

Speaking of which, why DOESN'T Newsline have it's own read-only newsgroup?

I have to go to FidoNet,(aka Fight-o-Nuts), to find Newsline online!
Phooey on Fido!

HP 410C -- Analog millivolts, microamps, ohms, AC 20hHz to 700
MHz. $175.
HP 419A ï¿½ Zero Center DC Null Voltmeter, 3 microV to 1000 V full
scale. $350.
HP 334A -- Distortion analyzer & AC voltmeter, auto null, RF
detector (up to 65Mhz), 1 Khz highpass filter. $450.
HP 3400A ï¿½ 10Hz-10MHz true RMS, -72+52 dbm, 10meg Z-in (BNC). $195.
HP 3490A -- DMM, AC, DC, ohms, self test, 5-1/2 digit LED, 1KV,
4-wire high
accuracy measurements, $250.
HP 8405A ï¿½ Vector Voltmeter 1Mhz-1000MHz, .1 degree res., -70+10
dbm. $800.
Boonton 92B -- 10 KHz to 1200 MHz RF millivoltmeter, -60 to +23
dbm. $350.
Boonton 93A -- RMS volts, 1 mv to 300 volts, dbm & volts, 10 hz to
20 Mhz. $225.
Boonton 42CD/41-4E -- RF microwattmeter, 18 gigahertz, analog and
digital readouts, autoscale, DBM & watts, $795.
Fluke 8375A DMM, 5-1/2 digit, $275.
Dana 5100 DMM, compact, 5-1/2 digit, .01%, $325.
Ballantine 3015 AC voltmeter 10hz - 4Mhz, 1mv to 300v f.s.,dbm
$195.

=== OSCILLOSCOPES (with NEW 100Mhz probe) ===

Tek 453 -- 50 Mhz, dual tr, 5mv, delayed sweep, $350.
Tek 455 -- 50 Mhz, dual tr, 5mv, delay sweep, $375.
Tek 475 -- 200Mhz, dual tr, delay sweep, portable, $595.
HP 1720A -- 275 Mhz, dual tr, delay sweep, 50 ohm or 1 meg. input
Z, quiet (no fan). $549.
HP 1725A -- 275 Mhz, dual tr, delay sweep, +/- .5% delta time base
accuracy, 50 ohm or 1 meg. input Z, quiet (no fan). $595.
HP1741A -- 100 Mhz, storage, dual tr, delay sweep, trigger view
(3rd ch), 1mv sens. $650.
Tek 1106 Ni-Cad battery & charger pack for 455, 464, 465, 466, 475,
& 475A scopes w/manual. $150.

=== GENERATORS ===

HP 204C -- Oscillator, 5hz to 1.2Mhz, sync. port, 5v out. $150.
HP 652A -- Test oscillator, 10hz to 10Mhz, attenuator, flat
+/-.25%. $250.
HP 8005B -- Pulse, triple output, flexible, .3hz to 20 Mhz. $450.
Wavetek 145 ï¿½ Sine, Triangle, Square, +/- Pulse, .0001 Hz to 20

MHz, 80 db attenuator, DC offset, 30 volt P-P out, sweeps 1000:1 range.
$295.
HP 213B ï¿½ Pulse, < 100 picosecond rise, 175 mv into 50 ohms. $195.
Wavetek 148A ï¿½ Two generators in one box, .0002 Hz to 20 Mhz, sine,
square, triangle, ramp, pulse, AM, FM, PM, 30v P-P unloaded, internal or
external modulation, sweep, trigger, gate. $750.
Ballantine 6130A-101 ï¿½ Time Mark Generator, .1 microsecond - .5 sec
in 1-2-5 sequence, + sine out @ 20, 100, 200, 500 MHz and trigger out.
$250.
URM 26B ï¿½ 4 Mhz to 405 Mhz, 0-50% am. $175.
Logimetrics -- 925/S125 50 Khz - 80 Mhz RF gen., -127 to +23db,
6-digits. $650.
HP 8601A - .1 to 110 MHz sweeper, -110 to +20 dbm, 1KHz AM/FM,
$395.
HP 8660A ï¿½ 10 KHz to 110 MHz synthesised signal generator , 9-digit
thumbwheel freq selector, +13 to -146 dbm. $1195.
Wavetek 3000-200 -- RF synthesized generator & deviation meter, AM,
FM, CW, & DC (for up to 100KHz sweep, or burst modulation), 1 to 512
Mhz, +13 to -137 DBM, six digits, .001% stability, reverse power
protection. $850.
Wavetek 3001-691 -- RF synthesized generator, AM, FM (up to +/-
500KHz), CW, & DC, 1 to 512 Mhz, +13 to -137 DBM, six digits, .001%
stability. $795.

=== COMMUNICATIONS ===
Marconi TF 2300A FM/AM modulation meter, 4 MHz to 1 GHz (1.6 GHz
w/ext osc), FM deviation to 500 KHz, AM to 95%, solid state. $495.
Wavetek 3000-200 -- RF synthesized generator & deviation meter, AM,
FM, CW, & DC (for up to 100KHz sweep, or burst modulation), 1 to 512
Mhz, +13 to -137 DBM, six digits, .001% stability, reverse power
protection. $850.
HP 334A -- Distortion analyzer & AC voltmeter, auto null, RF
detector (up to 65Mhz), 1 Khz highpass filter. $450.
HP 3581C sel. level mtr., 15Hz - 50 KHz, 5-digit LED freq. readout
& analog log/lin meter, 1 Hz resolution, AFC, +30 to - 150 dbm, scope
or X-Y recorder out. $650.

=== MISCELLANEOUS ===

HP 741B ï¿½ DC Voltage Standard & differential ac/dc VM, .01%, 10
microvolts to 1000 volts. $750.
Fluke 407DR High voltage, high accuracy power source. 0 to 555.55
(+/-.25%) volts @ 300ma, 0 to 25 volts, 0 to 250 volts, .01% regulation.
Also two 6.3volt @ 5 amps AC . $350.
Tektronix Y-T Chart Recorder, for use with 1500 Series TDR
instruments. Like new, with manual. $250.

There is an excellent book available that covers all of these
subjects, the title is Six Meters, A guide to the Magic Band,
by Ken Neubeck, WB2AMU. I highly recommend it. I learned a
lot, even though I have operated 6 meters before.

I will attempt to answer your questions.
Verticals will work when the band is open. 10 Watts is adequate
when the band is open. However, when the band is partially
open, you may want more power and/or a beam. If TV channel 2 is
used in your area, TVI may be an issue, but low power and
vertical polarization may help reduce TVI problems. Most
serious 2M SSB work is horizontal, but once it has hit the
ionosphere, either polarization will work for skip. The
peak skip (Sporadic E) season is May, June and July.

I am looking for a good battery for my Kenwood Th-79.
I have heard that the original (5W) battery needs to
be totally run out before charging. I am hoping to find
a battery that has no memory and can be "topped off"
without memory problems. Any suggestions?

Thanks,

Yes it does. The range is from 67.0 to 256.4 HZ tones. You can have it
set so that the transmitting tone is different than the receiving tone.

Dick,

Take a look at my Web page, The Vibroplex Collector's Page, hosted on
www.la.ca.us. The URL is:

http://www.la.ca.us/frandy

Your Vibroplex was made in 1942 (according to WW7P) and may be a
Champion, Lightning Bug, or Zephyr. Images of all three are on the Web
page, plus lots of other information. Basically, if it doesn't have
a circuit closing switch you have a Champion. If it does have one you
have a Lightning Bug if it's on a 3.5" wide base or a Zephyr if it's
on a 3" wide base.

Ted:

Here is the complete list of radios that match your specs:

NONE!

$200-$300 for a TR-9130 is cheap. You usually can only get a TR-9000 for that! Even the current FT-290RII from Yaesu only has 11 memories, and a single channel, dip switch programmed PL board.

Kenwood's TR-751A is the earliest rig that comes close. Expect to spend $500-$600 for one. 2-meter all mode portables/mobiles have never been numerous or popular, and tend to retain their resale value. Most SSB/CW enthusiasts (myself included) will gladly sacrifice repeater-oriented features for a good receiver and features oriented towards our mode of operation.

I might add that the reason that the FT-50 does not do well on Broadcast FM is that it is +/- 75 KHz deviation, which is wider than the "wide" filter on the FT-50. The FT-50 does do very well, however, on television audio, which is +/- 25 KHz deviation, or on the fax transmitted from the weather satellites, which is +/- 15 KHz deviation - and uncopyable on most other receivers!.

One comment from the manufacturer (off the record) was "everyone has a "Walkman" ... we didn't want to duplicate that, but we did want to build a handheld with a good VHF Communications Receiver section (as opposed to an entertainment receiver)."

Yaesu makes a neat little adapter (model number CT-30) that sells for ten or eleven dollars. I know for a fact that HRO sells them for $10.95. This device plugs into the ear/mic jack on the side of the radio, snaps up on the antenna, and provides two standard jacks for the earphone and microphone. This will allow you to buy one of MFJ's (or any other brand) pre-made radio-to TNC cable for any Yaesu radio. I've got one, and it really works well (the adaptor) and it looks good too!

I would be interested in the specifics, parts list and instructions,
before I open the radio and look at all the components with a looking
glass to see which parts are missing and are not. It seems that many
others here would too, by the other posts I have seen. I do agree though
that I black and white on the schematic it has an 800 MHz box.

Thanks

>broadcast FM?
>

The FM broadcast requires a VERY wide filter, which Yaesu
did NOT use in the FT-50. As a result, the signal
coming into the radio is of greatly truncated band-
width, thus signals sound simply HORRIBLE.

Of course, it receives narrowband FM wonderfully.

P.S. The stock antenna, compared to any other antenna,
is TRULY a piece of junk. Using an SMA adaptor and
an aftermarket dualband duck produced an improvement
from S3 to S9 when listening to 162.55 NOAA WX.

Hard to believe ANY antenna could be THAT bad, but
it really is. I suspect its performance on the 440
MHz band is slightly better than on 2m, but its 2m
performance is totally abysmal.

You have a valid point Ted, but holy smoke! If you want to know more
details about a piece of equipment, why not shoot a note to the seller
and ask him to expound instead of ripping his poor tender ass *smile* in
front of everyone and causing a bunch of commotion? It's really kind of
funny to see this thing string out like this, but c'mon.....

2110. ft-890 specs

Soon I'm going to be installing an audiopatch on my mobile radio in the house. Rather than use the 8-pin connector on front, it'd be much more convenient to use the 2 jacks in the back intended for packet. The main question is, are the audio in/out & ptt connections in back equivalent to the front conncetor and the external speaker jack? The instruction book says "The PTT control through the rear jack is solely for packet use only, and may not exhibit the same characteristics as the microphone PTT".... To me it seems like it would work the same... any input? Please email replies back to me. Thanks in advance.

Solution: Don't listen to commercial radio. It's bad for your brain
anyway.
Interesting that Kenwood had the problem on the 733, figured out and
published a fix, and then built a *state of the art* rig with the same
problem! Seems like they don't learn......
I wonder if that means the TS-570 will have the same audio overdrive
problem with TNCs that plagued the TS-450?
Makes you wonder if you're really upgrading??

>Thanks in advance,
>KF4MMF
>creed@Hiwaay.net

This sort of problem can be difficult to troubleshoot. You need to
take a systematic approach to isolating the problem. The first thing
to do is to isolate the system. Terminate the duplexer in a good UHF
dummy load with a 30 db coupler in series. (This may be built into
better communications monitors such as the IFR1200, but an inline
coupler can be used if you don't have such a nice instrument.)
Disconnect PTT from the repeater controller and arrange it so you
can control it manually.

Now inject a signal into the repeater via the coupler port and adjust its level so that it is near the receiver threshold. Now manually key the transmitter. If you have desense, you've eliminated the feedline, antenna, and any odd mixes from the list of possible problems. Conversely of course, if you don't have desense, you now know the problem is associated with feedline, antenna, or site issues.

For the moment, lets assume you do have desense during this test. Some of the possible problem areas are faulty interconnect cables (especially poor braid connections at connectors due to corrosion or poor installation), damaged finger stock in the duplexer (often caused by lightning strikes), or loose shielding on the receiver or transmitter strips.

The best way to determine if it is a cable problem is to substitute a known good cable for the suspect cable and repeat the desense test. A cruder test is to *wiggle* the cables during a desense test. If wiggling one of them changes desense, you've got a hot suspect in your hand. (A cable can be bad and still pass the wiggle test, so this isn't surefire, substitution is the only sure test.) Note, the bulkhead connectors at the duplexer and at the radio are also suspect. Examine them carefully for evidence of burnt, bent, or corroded fingers, and look at the dielectric for evidence of arcing. They may look fine and still have a problem, however, but since they are hard to substitute, eliminate other things as the problem first.

Burnt fingerstock in the cavities will usually show up during tuning. You'll see jumps in the duplexer response as you adjust the faulty cavity. This is best done on the bench with a spectrum analyzer and tracking generator, though a network analyzer can be used too. If the cavities are such that you can easily open one end, do so and eyeball them.

Now what if you didn't have desense in the above testing? Now you've got to look at feedline, antenna, and site issues. Again, substitution is the best way to troubleshoot cable and antenna problems. If the problem goes away after substituting feedline and antenna, then look for burnt or corroded connections again. Test each piece individually if you can. One common problem with heliax is poor shield connection to the connectors, and another is center pin withdrawal due to thermal factors. Eyeball these connectors carefully, disassemble them and look for evidence of corrosion and note if the center pin protrudes properly.

Site issues are the hardest ones to resolve. If you are getting a mix from something else, the other transmitter has to be on when you have the desense problem. Simple observation at the site can determine if any other transmitter is active at the time you see desense. If none are, you can write off that theory. The problem can still be from an off-site source of course. Since you see desense all the time, you know you're looking for a transmitter that is on all the time. Good candidates are pager transmitters. They are often dirty, and they are usually on all the time.

You can use an intermod program to give you a list of possible mixes with your transmitter which result in a product on the receiver frequency. Investigate all these possible frequencies with a scanner or spectrum analyzer. If you identify a likely candidate, try to get the owner to cooperate in a test. If the problem goes away when the suspect is switched off, you've found the villian.

Now the mix may or may not be taking place in the other transmitter. This will take some more detective work on the part of you and the owner of the other transmitter. If you put a 3 db power pad on the output of the other transmitter and desense drops by *more* than 3 db, the mix is very likely happening in the other transmitter. Try this test on your transmitter too. Check the tuning of the offending transmitter, these problems often appear when a final has recently been changed and not tuned properly. A circulator on the offending transmitter will also help.

If the pad only drops desense 3 db, then the mix is happening somewhere else. This can be incredibly difficult to find because any corroded junction *anywhere* in the area can allow a mix. If you manually force your repeater transmitter on, you can go around with a sniffer looking for the source of the mix. This is standard T-hunt and RFI hunting practice. Carry a hammer with you. Tower joints, guy turnbuckles, etc are likely sources of the mix. Give them a tap with the hammer and see if the problem changes.

While site grounding normally won't affect this sort of problem, *corroded* ground connections certainly can be a source of mixing. Eyeball them carefully, give them a whack if they look suspicious. Be persistent, you can find these problems.

Now the mix can also be in another piece of equipment, other than a transmitter, on the site. It can happen in the front end of another receiver (or yours), and it can even happen in non-RF devices like telephones, power supplies, etc. For other receivers (or yours), the pad test is surefire. If adding the 3 db pad drops the product more than 3 db, you can bet the mix is happening in what you just padded down.

(Incidently, the reason the pad test works is that it attenuates the *other* signal trying to get into the source of mixing by 3 db and then attenuates the product coming back out by 3 db, so if the mix is happening in there, you'll see a 6 db drop in the product with the pad in place. If the mix isn't happening in there, but the device is the source of one of the frequencies in the mix, the product level will only drop 3 db. Obviously, if the device isn't involved at all, no drop in product level will be seen with the addition of the pad.)

For mixes in non-RF devices, you have to disconnect and shunt them to demonstrate that they are the culprit.

Yes this can be moded to your needs. You need the service manual for this base and in the foldouts are charts with the diferent models and what componets need to be changed. It amounts to a few caps and maybe a coil.

2134. WTD: Manual to Kenwood AT-250 Ant. Tuner

Newsgroup: rec.radio.amateur.equipment

I just found an AT-250 tuner at the local ham swap meet, without the accessory cable that apparently connects to the rig, and need to get a copy of the manual so that I can hook it up to my TS-430s. Any help here is appreciated. I am good in the Callbook, and will happily compensate any expense incurred.

Greetings to all:

I am looking to trade for a Modifiable Pro 43 with cell capabilities or a Bearcat 250XLT - for Microsoft Office Professional 95 Two CD Rom Set. Brand new. Never Used.

I also have a Casio Programmable Midi Compatable Keyboard CTK 650 FULL SIZE: comes with the following:
128 General Midi Sounds - 128 Rhythms - Touch Response - 32 Polyphony - 16 Channel Multi Timble. Original Box and Manual.
Video Instruction Tape From Casio
Master Tracks Pro Software with 2 Video Instructional Tapes and manual.

I am looking for a pro 2006 with Opto board and modified with 6400 channels or AOR 8000 if possible or what do you have?

Thanks to all that reply via E-mail to:
billp@gramercy.ios.com

2136. Yaesu FT-50 - ordering with FTT-12

Message-ID: <32EA6FCD.741F@direct.ca>
Source record: 185107

Quick question for FT-50 owners;

Looking to purchase a FT-50. Can it be factory ordered with the FTT-12,
or does one have to purchase the radio with the FTT-11 and replace it
with a FTT-12?

Thanks in advance for any help

G. Scott Stewart

Hello,

I have for sale a "never been used" M300 mobile 10 thru 12 meter amp. It has a
high/med/low power switch, a switchable receive preamp, and a switch for
SSB delay. Does better than 250 watts SSB PEP.

Asking $150.00,

Thanks,

Eric Homa

Firther study of the schematic suggests that the RAM only contains some bootloading code that tells the microprocessor where in IT'S internal ROM to start executing the program. It also stores memory channel data.
I believe the mask programmed microcontroller may have code in if for several different Icom radios...the RAM gets loaded at the factory with the required 'personality' data to start the micro at the appropriate address for that particular radio.
If the personality data in RAM gets lost (battery dies ect..), then the micro in the radio will not be able to boot up and therefore the appears to be dead.
(Individually mask programmed micros for each model of radio is not cost effective when the code for several models could fit into the ROM space of the micro. This sorta explains some method to Icom's madness.)
This makes most sense to me as the RAM is only 1K X 4bits (not likely enough space for the required code to run the IC-271) and the internal ROM of the microprocessor is 4K X 8 bits (plenty of space to run code for more than 1 radio). Furthermore, the micro executes 8 bit instructions and the RAM is only 4 bits wide.

This is my theory and I'm sticking with it :)
Perhaps some others may back me up on this OR correct me if I'm wrong.

So, the next step is to determine how the addressing of the bootstrapping code and the memory channel data within the RAM is segmented, wire up an adapter and carefully read in the contents of the RAM (without losing it) and then build up another board with the bootstrapping code in ROM and some RAM for memories with the necessary addressing logic.

2139. Yaesu FT-470 Back-up battery keeps draining

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-25 00:00:00 UTC
From: cecere@ricochet.net
Message-ID: <5cdreu$ocv@news0-alterdial.uu.net>
Source record: 185110

My trusty FT-470 has had amnesia for a long time now.
every time i replaced the CR2025 internal lithium cell, the new one would only last a month or so before going dead.
sent it to Yaesu and they replaced the diode across it but that didn't help.
The next thing they suggested was to replace the motherboard,but that seems rather excessive, (since it would cost more then the radio is worth)

Any Ideas?
Is it possible to get schematics of whats going on in there?

I've been toying with the idea of simply bringing out the battery leads and taping on two AA batteries, kinda crazy but...

my best bet would be to buy a new radio (ha!) and use this as a base station/packet radio etc...

thanks,

Michael Cecere KF2NV

I have a Bearcat BCT-2 Multi band Scanner (that I have hardly used)
for sale.

It's a pretty neat device in that not only you can just punch in the
state that you are in (and it picks up Police, Highway Patrol, DOT,
weather, etc.) It also alerts you to the presence of radio waves in
the vicinity (has a large red light and beeps). That way it offers
protection from Vascar, airplanes, etc). It retails for $250+ and
mine looks brand new. Includes cigarett lighter plug, mounting
brakets, car radio antenna splitter/and wire antenna (that attaches
to your windshield with small suction cups).

$$ Best Offer.

PS. I will be in DC area in a couple of weeks (for the weekend).

2149. RE: Standard Radio Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-25 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <9701251434426992@atdbbs.com>
Source record: 185120

For those of you who have been asking, here is the
modification for the new Standard C5900DA TriBand Radio.

This modification is only for those who are a active
member of a MARS organization or Civil Air Patrol. To
have this mod, you must serve in some type of communication
capacity in the respected organization.

Step 1.) With the radio facing you, remove the top cover
of the radio.

Step 2.) Near the front center of the radio, you will approx.
observe 5 items in a row.

Step 3.) These are surface mount type capacitors and resistors,
you will need to remove RL99.

Step 4.) RL99 is not labeled on the PC board, so you will have to
estiminate which capacitor is it by the below diagram.

TOP BOARD

cap empty res res res cap cap

* * * * * ** **

* * * * * ** ** Box

* * * * * CL37 CL43 ******

* * * * * * *

* * * * * ******

CL93 PAO RL99 RL97 RL98

Step 5.) Remove RL99. It will be right next to the
empty slot. Use a very fine tip iron at
low heat. A small toothpick and solder wick aids
in removing the resistor.

Step 6.) Do a hard reset of the radio.

Step 7.) The radio will now transmit 40-80, 100-180, 345-495 Mhz.

It is illegal to transmit on commercial or public service frequencies.
All unauthorized modifications of your radio will void the
factory warrenty. Send a copy of your MARS/CAP license to Standard
Radio for authorization.

2155. ***ICF-SW77 SONY*** Any Modifications???

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-25 00:00:00 UTC
From: tanguy@iway.qc.ca
Message-ID: <32f5553b.6466485@news.citenet.net>
Source record: 185126

Salut
I just buy a sw-77 shortwave radio from SONY, and there is some fews
bugs in this radio.
1) The vfo is making a lots of sounds when you turn it, problems with
the synthesizer.
2) Audio is distortionned with strong signal (not very hi-fi, hi)
3) Station on FM is not on the frequency, you have to move a 50 khz

+/- to have a good sound.
4) NO SQUELCH

So my question:
Is there some modifications to improve this radio???
Is there some tricks for this radio???
Is there a way to change the up and down limits of a band for the
scanner fonction???

ANY INFORMATIONS OR MODIFICATIONS TO IMPROVE THE PERFORMANCE OF THIS
RADIO WILL BE APPRECIATED

> Which is a better value???

It's a tough decision. The '570 has DSP and the add'l freq display,
which can be handy. The '850 is a GREAT radio with more features and
more funtionality available on the front panel instead of always having
to enter menus. You couldn't go wrong with the '850. Zillions have been
sold and it is a known as a trouble-free rig. You can always throw an
audio DSP on it for rcv, and don't worry about transmit. An '850 sounds
great and there are lots of ways to alter your audio.

Although it's a horserace, my choice is the '850 by two lengths.

Dave

2162. Tubes and Test Equipment for Sale

Ted,

Pardon me, but I disagree with you 100%. In any transaction, the law of supply and demand determines the price, not an arbitrary figure of 50%. For example, I recently purchased a Yaesu FT-627RA 6 meter mobile through the internet. The rig was in rougher condition than I expected, so I relisted it, with an accurate description (case in fair to poor condition) for the exact same price I paid--$175, or about 80% of new price 17 years ago! The rig sold the next day, and I received a dozen more responses, so I had to post a "sold" notice.

The Kenwood TS-130V, one of the finest QRP rigs ever made, regularly sells for 120% of its original price when in mint condition. Ditto many early 2m and 6m SSB rigs which have good reputations.

A new IC-275H 2-meter all mode is being discontinued for $1700 or so. That's a closeout price! Is it any wonder that its predecessor, the IC-271H, which sold new on closeout for half that amount, still can be sold for the original purchase price?

To make matters worse, the older rigs tended to feature much more rugged construction that the newer ones. List a TR-9130 on this newsgroup for $350 and see how long it lasts... Not everything depreciates--some things even appreciate in value! They are called "collectors items" or "classics".

BTW, I am neither a vendor nor a dealer. Most of my listings have been WTB, for accessories to match the rigs in my shack. Thanks to an increased income and professional success, I am now buying a home and will then put up a first class ham shack, including items you would consider overpriced. So be it...

Remember your basic economic principles, and you will understand why these "boatanchors" of yours are not collecting dust, but being bought and sold every day.

Just my personal opinion...

73,
Martin

2167. Re: Need info on FT-77 or any other older solid-state rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-25 00:00:00 UTC
From: AL7OQ <mfeldmn@ibm.net>
Message-ID: <32EAD3B8.50F9@ibm.net>
Source record: 185138

Michael:

The FT-77 you mention was a fine rig (I had one for years--excellent receiver), but it was not general coverage, and neither was the TS-130S (also excellent-I have the TS-130V QRP version). The price class you require makes general coverage difficult to come by--you wont get a TS-440S or IC-735 for that.

Here are four early general coverage rigs you may get for $500:

Drake TR-7
Icom IC-745
Kenwood TS-430S
Yaesu FT-757GX (original version)

All are good radios, all had their quirks. I like the Icom and the Drake best, but that's just personal preference. Two rigs that will sell for less, but that should be avoided like the plague:

Icom IC-720
Icom IC-720A

Don't get me wrong--both are solid performers. The problem: they use a solenoid in the band switching circuit that is no longer available, and those solenoids are dying due to old age. I did read about a mod in a British ham magazine that called for replacing the part in question with a different British-made solenoid, but there was a difference in the size of the parts and major surgery was required.

In any case, I wish you luck. The Icom IC-735 is particularly popular among hams on fishing boats in Alaska, though it is NOT legal to use it on the marine bands. Resale value for a clean one is about $600-$650, and probably worth the money. Of course, for a little more you could get a new IC-707 with a warranty.

I hope my thoughts help...

73,
Martin

2175. Re: IC2SAT -- faint LCD. How to fix?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-25 00:00:00 UTC
From: cwop@aol.com
Message-ID: <19970125053700.AAA06696@ladder01.news.aol.com>
Source record: 185155

My IC2SAT LCD gets very faint just before battery failure, but the receiver and transmitter still work ok for another 5 minutes or so. If your battery and charging system are ok then you might check the voltages around the LCD module to see if they are up to snuff. My HT is over 6 years old now and there is no noticible difference from when it was new. However it always has been easier to read when you tilt it back as you mentioned so that may be the nature of the beast.

2180. Re: Recommendation for CW Key

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-25 00:00:00 UTC
From: cwop@aol.com
Message-ID: <19970125055501.AAA07502@ladder01.news.aol.com>
Source record: 185160

At about 15 WPM I think your ready for a keyer. However, straight key people think bugs are a bad idea. Bug people think that keyers are bad. and keyer people think keyboards are bad. Well maybe thats not quite true but it's really pretty much a matter of choice. I happen to use a mouse to key with. It's a modified computer mouse that's hooked to a keyer and I push the buttons for CW. I origionally made it for my CW mobile but liked it so well I now use it all the time. It works great when I lay back in my recliner to do a little hamming.
I personally would suggest a keyer/paddles as I think they are the easiest to use. My arm and hand always got sore after after a straight key session.

I am a new user but discovered the same problem and found that I could turn off the remote control from the MENU <remember to perm it by saving it in PF or you will lose it after turning the radio off and on> and you still get up/down, touch tones, PF, VFO, MR, etc. - you just lose the CUSTOM stuff. At least you can finish your vacation without having radio stations audio reprogramming your "Cool Blue". I found the problem when I dialed my cellular phone - what a suprise! :-)

2186. FS: FT-811 & IC-12-AT

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-25 00:00:00 UTC
From: John Kirby <yarak@mcs.net>
Message-ID: <5cbm22$7ds$1@Nntp1.mcs.net>
Source record: 185166

For Sale:

1) Yaesu FT-811 440 mHz handheld with FNB-17 (low V) Ni-Cad battery pack, antenna, wall charger, instruction manual, and box. 8 months old, low time, very clean. $175 shipped UPS ground.
2) Icom IC-12-AT 1296 mHz handheld with two BP-3 Ni-Cad battery packs, wall charger, antenna, extra (brand new) Icom antenna (original type), and instruction manual. Good condition - a great way to get on 1296 for cheap. $200.00 shipped UPS ground.

Of course, I'll entertain offers for the above. I will be at the WCRA hamfest to be held this Sunday, 1-26-97 in Villa Park, IL - most likely on 446.660 simplex. I'am looking for a Yaesu FT-51R dual bander, too. Reply to yarak@mcs.net

Thanks & 73 - Ken W9LSL

I'am posting this for a friend, so there will be some slight delays in responses. 73 - John KB9NLY

Source record: 185170

I used both radios as one of the team at ZL8RI Raoul Island May 1996. Both are superb radios. I must make this comment though. The FT1000D is a refined lady, whereas the FT1000MP is a painted lady and a tart. Both have their virtues. Both have their uses, Both are very different. I must say though, after returning from Raoul Island... I bought and FT1000D. It's a class radio, a joy to use and a must in pileups

There's a lot of misinformation going around about NiCad batteries. In fact, most of what is called "memory effect" really comes from leaving the battery on a charger way too long. It is probably best, if possible, to run the battery down to the point where the radio automatically shuts off before recharging. However, do not run the battery completely flat -- that is NOT good for them. If you need to have it fully charged before it is completely run down, go ahead. Just be sure to limit the charge time (standard wall charger) to 15 hours or so. Make that fewer hours if it is a fast charger. DO NOT leave the battery on the charger for days at a time. That is what causes shorter life. Hope this helps.

Chiron: Don't feel bad! Most of the modern texts do a terrible job
of explaining how simple VSWR measuring equipment actually works.
These devices are very simple in their construction, but understanding
their function requires some study of the physics involved.

Take a look at the February issue of the American magazine "73 "
There is an article there. Also, see if you can get someone in a
local amateur radio club to provide you with the August 1965 issue of
QST magazine. I know this may be difficult where you are. Let me
know if you need help.

Howdy i@toke. No antenna "gets" gain since you can't get more out of an antenna than you put into it. You can however, change the pattern of radiation with regard to direction and angle, hence gain relative to a "standard" antenna. The "standard" being a dipole, 1/4 wave, or a theorical antenna termed an isotropic radiator which radiates equally in all directions. Thus "gain' is expressed as decibels relative to a standard. For verticals "gain" is achieved by lowering the angle of radiation so that more energy is directed to the horizon instead of straight up in the air. For your vertical project you may want to try a 5/8 wave, J-Pole, or perhaps a colinear array. A good book on the subject is "Vertical Antennas by Bill Orr, W6SAI", ISBN 0-933616-09-0, available at most Ham Radio Stores.

Good luck with the project. There are some antenna project links on the URL below including a J-Pole.

I have a Bearcat BC-2 Multi band Scanner (that I have hardly used)
for sale.

It's a pretty neat device in that not only you can just punch in the
state that you are in (and it picks up Police, Highway Patrol, DOT,
weather, etc.) It also alerts you to the presence of radio waves in
the vicinity (has a large red light and beeps). That way it offers
protection from Vascar, airplanes, etc). It retails for $250+ and
mine looks brand new. Includes cigarett lighter plug, mounting
brakets, car radio antenna splitter/and wire antenna (that attaches
to your windshield with small suction cups).

$$ Best Offer.

PS. I will be in DC area in a couple of weeks (for the weekend).

>Thanks,

>Rabelo
>PY1PRP
>prabelo@centroin.com.br

The resets are:

Turn the radio OFF.
Hold the MR key down, and turn power on.
Release the MR key, and push it again.

Hope that helps,

>
> tnic@ios.com

Hello all, I just bought a FT900 without the collins filters or
internal AT antenna tuner, and couldn't be more pleased with. It
will work as mobile or base, and the front panel easily snaps off
for mounting anywhere within 6 meters of the radio. AES threw in a
YSK seperation kit (cable, panel mount and mobile mounting
brackets) free, and there is a $100 coupon right now.. I doubt
that you could get much more of a base station at the price I
paid, although the Icom 706 is about the same price and the Alinco
DX70T is a good bit cheaper, but they don't have the features that
the FT900 has.
I don't think that I can recomend the AT option, as it only works
if the antenna is already within a 3:1 SWR, which makes it next to
useless unless you have one dipole on 80 or 40 and want to cover
the whole band without retuning a manual tuner. The internal SWR
meter is so slick that using a manuyal tuner is really quick and
easy. The Collins filter (the C part) may be more useful in really
crowded band conditions, but the standard filters work fine also.
I would buy the plain jane FT900 and use the money saved over the
CAT version on the narrow CW filter and a good external tuner.
One more comment- I upgraded from a Yaesu FT 757, and kept my
FP757 switching power supply. For whatever reason, the protection
circut in the PS would trip 90% of the time when I first turned
the 900 on, but on those occasions when it held, it powered the
radio fine at the full 100 watts. I finally resorted to removing
the protection circut (the little black relay) and using the
inline fuse holders to protect the radio.

Robert....As with all other bands vert is FM and horiz is SSB.

most all of the "fun" on 6 (to me anyway) os SSB. When 6 is open 10 watts is fine, if it isnt open power doesn't make a difference. The 3 el beam is fine when the band is open. Most openings are sporatic E openings. 500 mi, in summer you can work double hop 1000 to 1500 mi. Listen to the call freq around dusk to the west and at dawn to the east fro grey line activity. North for aroura activity is solar flares are predidcted.. Have fun

Cross-posted to: sci.electronics.misc,sci.electronics.misc,rec.radio.amateur.equipment,rec.radio.swap

I have two old scopes that are free to a good home for the cost of shipping. I am in Southern California.

The 551 is missing the required power supply but is otherwise complete, including two type L Plug-Ins. No way to test if it is working without that supply, though.

The 545 worked for awhile, but the relay that engages the beams is no longer engaging. It is also complete, including a Type CA Plug-In.

Again, I hope that a devoted Tek collector has a warm place in heart and home for these museum pieces.

2219. FT-50 QUESTION?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-26 00:00:00 UTC
From: mike <ACABAMS@WORLDNET.ATT.NET>
Message-ID: <01bc0bc4$ac5b6e60$187174cf@default>
Source record: 184999

I have an interference problem from a local public service freq. They have four transmitters 460.100 , 460.125, 460.150, 460.175mhz. The audio from the base at the repeater is really cranked up and causes major splash, even into the amatuer 440 bands. The one machine at 460.150 is really bad.

The above freq's cause major problems to any radio I have, Yaesu ft-50,Yaesu ft8000 and Icom W32. It totally knocks out any 460 reception and even causes problems in the 440-450 range.

What can I do, who can I complain to? How do I describe the condition when I complain, I mean what is the condition reffered to as.

motorola maxars use a 10.7 if on the rx so you can use any standard scanner xtal to bring up the rx to test the rig. I have the book out in the garage on them and will look up the formulas . however I need to know what band this is on so I can get you the correct xmit xtal formula. If you are unshure what band it is in. get a few scanner xtals and your sig gen and find out what band the rx is in. or if it has xtals in it allready just fing it with the sig gen. If you need more info just drop me a note.

>
There are different formulas, depending upon the band of the
radio. The transmitting frequency is just a multiple of the crystal
frequency, both are usually stamped on the crystal. The reciver crystal
is usually the operating freq - IF (either 10.7 or 455) divided by
somenumber. If you have crystals you can figure it out. I believe I
have a VHF manual, so if you let me know the range of the radio (or model
#) I can give you the exact frequencies. PL is determined (and changed)
by changing the tone encoder/decoder reed in the PL board (that mounts
above the chasis near the speaker.> >

David,

I regret to inform you, the IC-245 isn't worth much. It was Icom's first digital 2m mobile, and has some problems. Most annoying is that the feed-throughs on the two sided board go flaky. The CMOS IC chip is impossible to replace when it fails--no longer available. I've seen units with the SSB adapter go for as little as $150 in good condition, since this rig has a very poor reputation. As an FM only rig, you're looking at a two digit price tag, even for a mint unit.

I had one (with SSB adapter) years ago, and it performed fairly decently, until the IC chip failed.

73 & good luck,
Martin

I need info or a source of info on a french military radio set.
I beleive made in the US, looks similar to a american AN/PRC-104.
Probably manufactured in the 1980's. VHF FM? SSB? Data modes?
Approx: 28 lbs, 8 x 10 x 3
Freq's: 33 to 47
Markings as follos:
STTA
EMETTEUR-RECIPTEUR-ER79A
MARCHE No74/83006

STTA
CASE CY 744 A/PRC
CSF.79 Bd HAUSSMANN PARIS

Any information would be appreciated.

Use of an autopatch on a home station falls into the same rules as a rptr autopatch...you MUST have remote control of the station (either wireline OR RF ABOVE 222.15 Mhz), it MUST ID properly at 10 min intervals when in use, and a control op MUST be present at the control point when it is in use....
> packet. The main question is, are the audio in/out & ptt connections
> in back equivalent to the front conncetor and the external speaker

> would work the same... any input? Please email replies back to me.
> Thanks in advance.

The packet PTT may have a short timeout timer built into it.....I doubt it but it seems the manual seems to indicate this...what rig is it and what is your callsign??

WHY is it that EDU types forbid for sale on most edu remailers??? Gee folks, thats one reason WHY I may want to subscribe is find equipment that is IN that category.....(some ham remailers are the same way...some people are into something I dont fathom....IF you are willing to put a remailer on for a subject, EXPECT for sale and wanted msgs.....if you dont want them, DONT bother putting the remailer on)

I am seriously considering dropping my interest in the LMR remailer... and some other amateur remailers....
other than some minor technical talk (which I find here and in Homebrew), I really dont have a need for it...NOW if I could sell some excess equipment or locate something I am NEEDING, it would have value to me..

Bob Dashoff wrote:
>
Can I use a vertical for both local repeaters and skip?

Yes, but it's a compromise. When there is long haul ionospheric propogation, polarization doesn't matter much, but for other types of openings, or working when there is no opening, wrong polarization (horizontal vs. vertical) costs you 20db of loss--making operation difficult or even impossible. Almost all SSB/CW work is horizontally polarized, FM is vertical. Best choice--have a beam and a vertical. 90% of more of 6 meter activity is SSB, so the beam is more important.

Is 10 watts sufficient for most work?

With a good antenna, absolutely! Under marginal band conditions, or with a poor antenna, probably not.

What time of the year is the long haul season?

Depends where you live. At the peak of the sunspot cycle (2-3 years from now) F-layer openings can happen any time of year, usually around midday. E-skip is best in the spring and early summer, plus again during a short season in December. However, it's called sporadic-E for a reason: it is not predicatble and can happen at any time. If you live in the Southern U.S., trans-equatorial propogation is best in the fall, particularly October, and can combine with E-skip to provide rare openings further north. In the northern U.S., auroral propogation is best around the equinoxes, but can also happen any time in winter. Meteor scatter happens during any major meteor shower. The short answer: 6m is completely unpredictable, which is why it's so much fun.

Which polarization, vertical or horizontal.

Horizontal for SSB and CW. Vertical for FM. Again, 20db loss for wrong polarization.

Is that Crushcraft 3 element yagi a good one?

It's fine. Remember, though, the more elements, the more gain, and the more directivity. I've had fantastic results with a 5-element beam.

Can I work the skip on a vertical?

Yes, you can, see above. A beam or quad will do far better.

Any comments would help immensely.

I hope this helped. 6 meters is my favorite band. I run an Icom IC-551D (80 watts), and just picked up a Yeasu FT-620B (10 watts) as a backup rig. I'm temporarily off the air since I'm living in a corporate apartment, but am looking for a house, and expect to be on again with a beam soon.

73 & Good luck,

Martin

>You get minor (maybe 20 Hz or so) random transmit frequency jumps. I
>guess the same processor is used for frequency control and the keyer.
>

Hallo Scout - ownwers,
running now about 2000 cw-qsos with it. The cw-speed is fully
variable, no problem. But if you like the high-speed, >25wpm, its
getting really warm at the backsite (40-50 w rf), especially working
mobile during summer. (The SWR therefore should not be worse than
1,2!) The keyer-electronic then is running out of order, shortening
or loosing dits sometimes. The cw-tone can become sometimes a small
chirp.

If you decrease the output to 20-30 wtts rf. everything is ok!
This is needed only for qrq, h i g h - s p e e d keying.

73s,
Manfred

My favorite screen of all time was the 647A. Great tube-- 100MHz.
But newer features and better triggering make it a dinosaur.
I still keep a 561A around for LF work (plug-ins are really cheap and
pretty easy to find).

Give a call to Pacific Coast Parts - they are Kenwood's Retail Parts
Outlet - they are up in Torrance, CA (I think) - and their 800 number
escapes me at the moment, and my "resource file" is not immediately
available!

I hope some one can help me with this. I was making the mars/cap mod on the yaesu ft-50, and did a stupid thing! my iron slipped, and hit a 2nd and 3rd resister above the jumber. know, that radio squelch stays open, and does not transmit on low power and has NO recieve. Can anyone help? I have thought about sending it back to my dealer or yaesu in hopes they will fix it under warranty....any thing I can do?

2260. FT-8000 RX 800mHz

Newsgroup: rec.radio.amateur.equipment

Hello,

Anyone know how to open up all 800mHz RX frequencies on the FT-8000?

Thanks,

Jim..

Amateur Radio for sale:
Alinco DR-590 Dual Band Mobile
2 meters / 70 cm
with antenna duplexer, in mint condition
has tone decoder/encoder and dtmf module
works great !! Over $600 spent, asking
$400 plus COD shipping (about $15.00)
email directly for more info ... Thanks

Cory

2262. ForSale: 37' Telescoping Mast, $45

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-26 00:00:00 UTC

Telescoping Mast for sale
in San Jose, CA.

37 foot Telescoping Mast, material is schedule 80 PVC Tubing,
in 4 sections, with O.D's: 3.50", 2.75", 2.25", and 1.75". The
sections are held in place by a u-clamp and thru center eye-bolt
arrangement. Each u-clamp has 2 outer eye-bolts, along with the thru
center eye-bolt, which are used as guy points.

The bottom 3 sections use PVC sched 80 reduction union joints (very
beefy) which I reamed out to allow upper sections to slide thru
freely. The three over-lapping sections are over lapped by 12, 16,
and 18 inches, from smallest to largest dia., respectively. Each
upper section has 2 sets of 3 spacer bearings that take up the
excess play inside each over-lapping section.

As you may well have gathered, I have an Engineering background
and took some time designing this Telescoping Mast. It wasn't
something I just threw together.

The last 2 years in San Jose, CA, has brought storms with winds as
high as 75 mph. This Mast barely moved during these storms. Also, I
use three sets of guys which are marine-type nylon rope that is UV
resistant.

Mast is more durable and can withstand higher wind speeds than
a steel mast, when guyed properly. Also, Mast doesn't interact
with antenna like a steel mast would.

I detect an idiot somewhere here. If I buy a money order and send it out I do NOT want to hear about the S.O.B. on the other end sending it to someone else because he agreed to sell it to more than one person, and whoevers mail is faster wins. BULLSHIT!
If I agree to buy and send a Money Order/check/ whatever, I expect it to be honored. First check to arrive in the mail is pure and simple crap. What does this person do, cash all of them???
Bill Baka, I keep MY word!

2264. Radio Tower Sections Used as a Cable Trough? Need Your Thoughts.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-01-26 00:00:00 UTC
From: valenta@ibm.net
Message-ID: <5cf89a$1tb8$1@news-s01.ny.us.ibm.net>

I'm thinking about using TV tower sections (ham or "home" style) to use as suspended cable troughing around our post production facility and am seeking thoughts and opinions.

I would suspend the sections from the floor above with threaded rods mounted to the metal joist or supported underneath about 6" from the tops of equipment racks. A PE will be consulted about positioning and needed support. I would use two or three sizes of tower for different signals. I was looking at 12" or greater for video, the same size for audio and a smaller size for control and digital video. I would set two of them side-by-side, a few inches apart, with the third one set up-side-down between the other two with wood bracing to electrically isolate and hold this third one in place between the two.

Cable drops would be between the members of the tower sections down into a four inch space between the racks intended for cable runs. Tower sections would be electrically isolated from the racks, receiving there grounding from the upper floors supporting structure to reduce ground loops. All rough metal ends will be ground smooth to facilitate the pulling of cables through the middle of the tower sections. Intersections will be fabricated by a local machinist.

The few questions I have are,

What are the standard face sizes of tower section? More generally, what is being made and by whom that you might think I should look at?

Does anybody make a "tower T section?

What of these collapsible towers that I see a lot of Hams (Amateur Radio Hobbyists) with? Are the telescoping sections sold separately?

Though it would be a little harder to pull cables through verses the more open standard cable troughs, I'm mainly looking for something more pleasant looking then the "old, industrial looking" troughs. (I'm unable to use computer floor) Most Importantly, do you think this will look good? Keep in mind that this is for a Video Post production facility that is located at a decommissioned airport, (Old Staplton International in Denver) with a lot of large round air ducts or pipes. and a lot of high open glass with square aluminum bracing.

Thank You for your time.

How many versions of both models are on the market??
And do all the versions work with 1750Hz tone burst as
needed in Europe??

2266. VHF private phone patch

Newsgroup: rec.radio.amateur.equipment
